Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged. Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

## 14MM Pitch HT200 Belt Drive Selection Table

| Speed Ratio           | Sprocket Combinations |                   |              |                   | Center Distance, Inches |             |             |             |             |             |             |             |             |             |             |

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
 Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

# SELECTION

## 14MM Pitch HT200 Belt Drive Selection Table

| Speed Ratio           | Sprocket Combinations |                   |              |                   | Center Distance, Inches |             |             |             |             |             |             |             |             |             |             |

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
 Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

# SELECTION

## 20MM Ratio/Center Distance Tables

| Drive Ratio                 | Sprocket Combination |            |              |            | Nominal Center Distance      |            |             |            |      |      |      |             |       |            |       |

**NOTES:** All 20MM HTD Drives operating above 1000 RPM may require a sound dampening guard.  
Belt lengths of 5200, 5600, 6000, and 6400 are also available. Interpolate center distance.

**NOTES:** All 20MM HTD Drives operating above 1000 RPM may require a sound dampening guard.  
Belt lengths of 5200, 5600, 6000, and 6400 are also available. Interpolate center distance.

**NOTES:** All 20MM HTD Drives operating above 1000 RPM may require a sound dampening guard.  
Belt lengths of 5200, 5600, 6000, and 6400 are also available. Interpolate center distance.

## Overhung Load Calculations

Overhung load is an important consideration for drive design. Motor and reducer bearings are rated for specific load capacities to achieve calculated life. If the drive design is such that bearing loads are exceeded, life will be proportionally reduced. Likewise, if the drive exerts a lesser load on the bearings, life will be extended. Needless to say, drive design that keeps bearing loads below ratings can pay big dividends.

**BELT PULL:** The basis for overhung load calculation is belt pull. Belt pull is the result of torque being transmitted when the belt exerts a pull on the sprocket diameter.

**EXAMPLE:** 5 horsepower at 200 RPM is 1,575 inch-pounds of torque. If a 6 inch diameter sprocket is used, (3 inch radius),  $1,575/3 = 525$  pounds effective belt pull is required. Note that if a larger diameter sprocket is used, belt pull is reduced accordingly.

Belt pull can be calculated using the following formula:

$$\text{Belt Pull (lbs)} = \frac{126,000 \times \text{DHP} \times F}{\text{RPM} \times \text{PD}}$$

Where: DHP = Design Horsepower

F = Drive Factor (1.3 for sync. belt)

RPM = Shaft RPM

PD = Pitch Diameter of Sprocket

**BEARING LOAD:** Belt pull translates into bearing load and is greatly affected by the location of the sprocket on the shaft. Fig. 1 shows an example of what happens as the distance between the centerline of belt pull and the adjacent bearing is extended.

Overhung Sheave

$$\text{Load at B, lbs.} = \frac{\text{Belt Pull} \times (a + b)}{a}$$

Fig. 1

| a      | b     | Belt Pull | Bearing Load "B" |
|--------|-------|-----------|------------------|
| 10 in. | 1 in. | 500 lbs.  | 550 lbs.         |
| 10 in. | 5 in. | 500 lbs.  | 750 lbs.         |

Now consider the same situation for a motor or gearbox.

Referring to Fig. 2, it should be obvious that the HT/HTD sprocket should be mounted as close as possible to the face of the gearbox.

As the distance between the gearbox face and HT/HTD sprocket increases, the bearing load is also increased, which leads to a reduction in bearing life.

Fig. 2

Another warning from gearbox manufacturers is that the centerline of belt pull should not extend beyond the end of the shaft. Given a choice of a small diameter, wide face-width drive design, or a larger diameter, narrower face-width alternative, the latter would be preferable if bearing life is an important consideration.

### DRIVE DESIGN CONSIDERATIONS

For any given application, there are usually several possible drive alternatives. In some cases, the selection with the smallest diameter sprockets might be the least expensive. As can be seen from the previous discussion, this alternative could be a bad choice. Smaller diameter sprockets lead to higher belt pull; their greater width is also more sensitive to misalignment.

## HT/HTD Drive Installation

### SPROCKET INSTALLATION

1. Thoroughly inspect the bore of the sprocket and the tapered surface of the bushing. Any paint, dirt, oil or grease must be removed.
2. Assemble bushing into sprocket. Loosely insert the screws into assembly. At least one sprocket must have flanges.
3. With key in keyseat of shaft, slide sprocket to its desired position with screw heads to the outside. If it is hard to slide the bushing onto the shaft, check shaft for burrs, etc.
4. Line up assembly so as not to misalign belts and tighten screws evenly and progressively. Apply the recommended torque to screws.

### SPROCKET ALIGNMENT

HT/HTD sprocket alignment and parallelism of the shafts are very important. Proper alignment helps to equalize the load across the entire belt width, thereby reducing wear and extending belt life.

Place a straightedge against the outside edge of the sprockets and move sprockets until the straightedge touches the two outside and two inside edges of the sprockets. The straightedge should cross the sprockets as close to the shafts as possible. A string can be used if a straightedge is not available. Remember the string should contact at four points as explained above. (See illustration on page PT11-66.

After aligning the sprockets, check the rigidity of the supporting framework. Shafts should be well supported to prevent distortion and a resulting change in the center distance under load. Do not use spring-loaded or weighted idlers. Idler sprockets or pulleys must be locked into position after adjusting belt tension.

## BELT INSTALLATION & TENSIONING

Do not pry or otherwise force the belt onto the sprockets, as this can result in permanent damage to the belt. Reduce the center distance between the pulleys so that the belt can be easily installed.

HT 200 drives must be properly tensioned. If the belt is too loose, it may jump teeth when heavier loads are applied. If the belt is too tight, belt life will suffer, and bearings will be unnecessarily overloaded. Improper tension can result in excessive drive noise.

Tensioning procedure: First, measure the span length and calculate the deflection distance of 1/64, per inch span (see illustration).

Use the formula method on page PT11-66 to calculate recommended deflection forces.

Apply a force (from the table) at the center of the span. Measure the deflection with this force applied. Move the center distance until the proper deflection is obtained.

## Drive Alignment

Good tracking of synchronous belts on their sprockets depends upon alignment to within 1/4 degree. This translates to a maximum “M” dimension of 0.05” per foot center distance.

## Drive Tensioning

### Formula Method

The formula method for determining belt tension may be used for greater accuracy, or for applications that fall out of guidelines given for the Simplified Method on page PT11-65.

#### Step 1. Calculate Min. Installation Tension:

$$\text{Formula 1: } T = \frac{20 \text{ (HP)}}{V} + mV^2$$

Where: HP = Horsepower  
 $V = \frac{\text{Belt Velocity (in FPM)}}{1000}$

$m = \text{Value in Table 1}$   
 $\text{Belt Velocity} = \text{PD} \times \text{RPM} \times .262$   
 (PD = Pitch Dia. in inches)

**\*Important!** If formula calculation for “T” is less than “Min T. Value” (Table 1) use the “Min T. Value” for T. Always use the greater T value: i.e. from T Formula 1 or Table 1.

#### Step 2. Calculate Deflection Forces:

$$\text{Formula 2: } \text{Min Force} = \frac{1.0T + (K/L)Y}{16} \text{ (lbs)}$$

$$\text{Formula 3: } \text{Max Force} = \frac{1.1T + (K/L)Y}{16} \text{ (lbs)}$$

Note: For used belt, use 0.7T to 0.8T instead of the 1.0T and 1.1T for new belts.

- T = Static tension, lbs
- K = Span length, inches
- L = Belt length, inches
- Y = Factor from Table 1

**Step 3.** Adjust tension per Simplified Method Procedure on page PT11-65 using deflection forces from Step 2.

Table 1

| Belt  |       | Factors |        | Min. T |
|-------|-------|---------|--------|--------|
| Pitch | Width | m       | Y      | Value* |
| 5MM   | 15MM  | 0.28    | 24.9   | 14.1   |
| 5MM   | 25MM  | 0.47    | 41.5   | 23.4   |
| 8MM   | 20MM  | 0.58    | 34.2   | 18.5   |
| 8MM   | 30MM  | 0.88    | 51.3   | 30.0   |
| 8MM   | 50MM  | 1.46    | 85.5   | 52.0   |
| 8MM   | 85MM  | 2.45    | 145.3  | 94.5   |
| 14MM  | 40MM  | 1.78    | 93.0   | 76.5   |
| 14MM  | 55MM  | 2.44    | 127.9  | 120.0  |

## DODGE Software

### Computer Selection of DODGE Synchronous Belt Drives

#### VIA-SYNC® Synchronous Belt Drive Selection

For any given synchronous drive application, there may be several DODGE HT/HTD\* or DODGE DYNA-SYNC® product combinations that could satisfy the requirements. Finding the best drive can be a time-consuming and frustrating task.

The DODGE VIA-SYNC program provides selections for DYNA-SYNC (timing) and HT/HTD drives and includes both TAPER-LOCK® and QD\* type sprockets. All relevant data for up to ten alternative drive selections is presented in a format that allows quick and accurate analysis, whether based upon lowest price, minimum bearing load, highest service factor, etc.

VIA-SYNC calculates speed up drives or drives for nonstandard motor speeds. The most appropriate selection can then be specified using the computer printout, which contains sprocket, bushing and belt sizes and part numbers.

VIA-SYNC has the capability of sharing data with DODGE T-A DISCOVERY™ or DODGE SCD DISCOVERY™ programs.

### DRIVE TROUBLESHOOTING

| Problem                      | Cause                  | Remedy                        |
|------------------------------|------------------------|-------------------------------|
| <b>Unusual Noise</b>         | Misaligned drive       | Re-adjust alignment           |
|                              | Hi or Low belt tension | Adjust to recommended value   |
|                              | Backside idler         | Use inside idler              |
|                              | Worn sprocket          | Replace sprocket              |
|                              | Bent sprocket flange   | Replace or repair             |
|                              | Excessive belt speed   | Redesign drive                |
|                              | Incorrect belt profile | Replace with DODGE belt       |
|                              | Subminimal spkt. dia.  | Redesign with larger spkts.   |
|                              | Excessive load         | Use higher capacity drive     |
| <b>Loss of Belt Tension</b>  | Weak mntg. structure   | Reinforce mounting structure  |
|                              | Excessive spkt. wear   | Use wear-resistant sprockets  |
|                              | Fixed center drive     | Install inside idler          |
|                              | Excessive debris       | Install adequate drive guard. |
|                              | Excessive load         | Use higher capacity drive     |
|                              | Subminimal spkt. dia.  | Redesign drive                |
| <b>Belt Edge Wear</b>        | Drive running hot      | Use heat fingers on hot shaft |
|                              | Belt degradation       | Protect from excessive heat   |
|                              | Damaged flanges        | Repair or replace sprocket    |
|                              | Low belt tension       | Adjust to recommended value   |
| <b>Pre-mature Tooth Wear</b> | Poor tracking          | Correct alignment             |
|                              | Guard interference     | Remove obstruction, add idler |
|                              | Improper tension       | Correct drive tension         |
|                              | Poor alignment         | Correct drive alignment       |
| <b>Belt not Tracking</b>     | Wrong belt type        | Use correct DODGE belt        |
|                              | Worn sprocket          | Replace                       |
|                              | Damaged sprocket       | Replace                       |
|                              | Excessive load         | Use higher capacity drive     |
|                              | Dirt or debris         | Install adequate drive guard  |
|                              | Sprocket wobble        | Correct bushing installation  |

| Problem                  | Cause                                | Remedy   |
|--------------------------|--------------------------------------|--|
| <b>Tooth Shear</b>       | Shock loads                          | Use higher capacity drive                      |
|                          | Few teeth in mesh                    | Redesign drive                                 |
|                          | Worn sprocket                        | Replace  |
|                          | Backside idler                       | Use inside idler                               |
|                          | Wrong belt profile                   | Use correct DODGE belt                         |
|                          | Low belt tension                     | Adjust to recommended value                    |
| <b>Tensile Break</b>     | Shock load                           | Use higher capacity drive                      |
|                          | Subminimal spkt. dia.                | Redesign with larger spkts.                    |
|                          | Debris in drive                      | Install adequate drive guard                   |
|                          | Improper belt handling, storage      | Do not crimp belt or subject it to sharp bends |
| <b>Belt Cracking</b>     | Subminimal spkt. dia.                | Redesign with larger spkts.                    |
|                          | Backside idler                       | Install inside idler                           |
|                          | Start-up temp below 180 degrees F    | Preheat drive before start-up                  |
|                          | Extended exposure to harsh chemicals | Protect drive                                  |
| <b>Bearing Failure</b>   | Excessive belt tension               | Adjust to recommended value                    |
|                          | Drive misalignment                   | Re-adjust alignment                            |
|                          | Subminimal spkt. dia.                | Redesign with larger spkts.                    |
| <b>Vibration</b>         | Wrong belt profile                   | Install correct DODGE belt                     |
|                          | Hi or Low belt tension               | Adjust to recommended value                    |
|                          | Loose key or bushing                 | Install per instructions                       |
|                          | Loose mounting structure             | Reinforce or tighten                           |
| <b>Belt not Tracking</b> | Misalignment                         | Re-adjust alignment                            |
|                          | Long center distance                 | Carefully adjust alignment                     |
|                          | Mtg. structure bending               | Reinforce mounting structure                   |

## FEATURES / BENEFITS

### HT500 Drives - The TCO Drive Solution: Energy Efficient - Maintenance Free

HT500 high torque synchronous drive system is the latest generation in the Baldor•Dodge synchronous product line. The HT500 belt is manufactured with polyurethane, carbon fiber cords and a black nylon tooth facing, featuring the modified curvilinear tooth profile. This drive system utilizes Baldor•Dodge's Taper-Lock® bushing system to deliver our most power dense synchronous drive in a compact package. Also available from stock: Fin fan sprockets with QD\* bushings, and minimum-plain-bore (MPB) sprockets.

\*QD is a registered trademark of Emerson Electric

#### What does the Sprocket bring to the Baldor•Dodge Synchronous Drive System?

Synchronous belt drives run slip-free and are proven to be more efficient and provide better performance than v-belt drives. They also offer significant performance advantages over chain drives related to wear and elongation resistance, they require no lubrication and have broad applicability. It is not necessary to retension synchronous drives – a significant advantage over alternative drive solutions. HT500 synchronous drives can also operate in wet and oily environments.

Baldor•Dodge HT500 synchronous sprockets are manufactured in North America with the highest quality standards.

#### Our design advantages:

- Positions belt center line closer to motor, reducer, and bearings reducing belt pull while potentially increasing the L10 life of bearings.
- Requires less shaft length than QD style products
- Offers more bore sizes per bushing size than QD style products
- Delivers more torque than QD style products
- Has no protruding flanges or bolt heads

The HT500 synchronous drive system has the potential to improve your overall power transmission package by increasing efficiency, lowering your maintenance cost, downtime, and belt pull to increase the L10 life of bearings.

Our high torque HT500 synchronous drive product is Baldor's commitment to your success by providing you energy savings and overall cost reduction. Another TCO solution for the marketplace!

#### Value added Features

- Virtually maintenance free
- Requires no oil or grease to run slip free
- No need to re-tension the belts
- Compact maintenance free design
- Modified curvilinear tooth profile
- Positive tooth engagement eliminating slippage and speed variation on high torque application
- Low installation tension reducing loads on other power transmission components (i.e., bearings, gearing, motors, etc.)
- Delivers power up to speeds of 10,000 FPM (Standard hardware is rated for 6,500 FPM). Contact Baldor if speeds greater than 6500 FPM are required.
- Higher power ratings than comparable timing belts, making HT500 suited to replace chain drives
- Wide range of stock parts available

Baldor•Dodge HT500 Belts utilize materials that achieve the highest standard of quality and performance in the industry allowing the superior torque capacity needed for high performance

- Belt backing is polyurethane designed for maximum resistance to environmental conditions, oil, grease, and high temperatures
- The belt's carbon fiber cords provide superior tension and torque transmission preventing belt shrinkage and stretch
- Belt's construction helps reduce the belt installation tension increasing the life of the other mechanical components
- Belt's teeth are enclosed in a black nylon tooth face delivering resistance to abrasion and tooth's shear, increasing drive efficiency, belt and sprocket's life, and reducing noise
- Idlers can be used on the backside and front-side of the belt
- With our TAPER-LOCK® bushing installation an easy on, easy off process is assured

# FEATURES / BENEFITS

## Energy Efficient, High Torque Belt Drive System

The US Department of Energy encourages the use of synchronous belts in all motor installations to maintain an overall efficiency rating of 98% across a wide load range. The HT500 Synchronous Belt is designed to offer the energy efficiency of a synchronous belt drive in a compact design.

**HT500 75HP Drive Example**  
**Energy Savings = Annual Energy Use x (1 – n1/n2)**

### Additional Benefits from HT500

- No Maintenance Cost
- Zero slip
- Constant time, speed
- Positive engagement
- Less downtime

**Our Value added solution will not only save you time and money short term, but many years thereafter**

# FEATURES / BENEFITS

## Energy Efficient, High Torque Belt Drive System

The Institute Electrical and Electronics Engineers (IEEE) conducted a survey to identify major causes of motor failures; the chart below is an abstract from their Petro-Chemical paper PCIC-94-01. It concludes that 51% of all motor failure is attributed to bearing problems. By decreasing the belt pull and overall overhung load, a motor bearing will last longer.

- Bearings
- External - environment, voltage & load. Likely to happen again.
- Shaft Couplings
- Rotor Bar
- Stator Winding
- Unknown - no root failure analysis

### Our Total Cost of Ownership Solution!

We want to offer you added value solutions so you can achieve your maximum potential cost savings

- Driver sheave diameter reduced by 38%
- Driven sheave diameter reduced by 37%
- Used 1 belt instead of 3
- Cost Reduction
- Reduced overall drive weight by 51%
- Belt pull reduced by 23% which increases the L10 life of the motor bearing by a factor of 2

## HT500 Belts

HT500 Belts are for use on Taper-Lock HT500 Sprockets  
 Belt length is in millimeters  
 To convert to inches, divide by 25.4

### 14MM Pitch HT500 Belts

## HT500 Low-Speed Design Load Calculations

For use when designing HT500 belt drives with low speeds

### I. Actual Operating Loads Known

In such cases where the actual operating load is known, design the belt drive for the actual operating load rather than for a load based upon the motor name plate. Use Equation 1 to calculate the proper drive design load based upon motor load (name plate or measured) when the belt drive will be installed on the reducer output shaft.

### Design Load

Equation 1  
 $DesignLoad = (MotorLoad) \times ServiceFactor \times (\% Reducer Efficiency/100) \times Motor Load$   
 Motor Load: From user/OEM  
 Service Factor: From Table 1  
 % Efficiency: From reducer manufacturer

Table 1—Service Factors for Low-Speed Drives  
 For Drive Selections With Shaft Speeds Less Than 500 rpm

| DriveN Machine<br><br>Select a driven load category whose characteristics most closely represent those of the actual equipment   | Typical drivers are electric motors, hydraulic motors, or internal combustion engines with hydraulic couplings/torque converters. |                  |                    |

#### Additional Guidelines

There are many driven machines using, or potentially designed to use, roller chain drive systems.

When converting these to HT500 drives, consider the following additional guidelines.

- Do not overlook the torque multiplying effect of belt drives and speed reducers when calculating with torque loads.
- Engineering judgment should be used in determining a design load for non-standard motors with high starting loads (NEMA C, NEMA D, Direct Current, etc.).
- For guidance in calculating speed reducer efficiency, refer to Speed Reducer Efficiency on Page PT12-24.

## Low-Speed HT500 Belt Drive Selection Procedure

For drive selections with shaft speeds less than 500 rpm

### Selection of a Stock HT500 belt drive system involves these eight steps:

1. Calculate the Design Horsepower
2. Select the Belt Pitch
3. Select the Sprockets and Belt Length
4. Select the Proper Belt Width
5. Check and Specify Stock Drive Components
6. Installation and Take-up
7. Calculate Belt Tensioning Requirements
8. Verify Speed Reducer Overhung Load

#### Sample Drive Selection Problem

A blank Low-Speed Drive Design Information Sheet can be found on page PT12-25. This form provides a convenient method for collecting data to properly design or convert to a HT500 belt drive.

In this example, an ore conveyor is powered by an electric motor directly connected to a speed reducer. A HT500 belt drive is needed to transmit power from the speed reducer output shaft to the conveyor shaft. The motor is a 5 horsepower, 1750 rpm normal torque AC motor.

The speed reducer is a worm gear type unit with a 50 to 1 speed ratio. The ore conveyor is to be driven at  $17.5 \pm 5\%$  rpm and operates 24 hours per day 7 days a week. The center distance between shafts is 50.0 inches, but can be altered  $\pm 3.0$  inches, if necessary. The speed reducer output shaft has a 1.500 inch diameter and the conveyor shaft has a 2.000 inch diameter.

#### Step 1 Calculate The Design Horsepower

The Design Horsepower should be calculated as follows:

$$\text{Design Horsepower} = (\text{Motor Load}) \times (\text{Low-Speed Service Factor}) \times (\text{Reducer Efficiency})$$

#### Procedure

A. The motor load can be determined by several methods as explained in the Low-Speed Drive Load Calculations section on pages PT12-22 - PT12-24. The method used for determining motor load will depend on how much information is available on the application. A worksheet is provided on page PT12-25 to help choose which method is most appropriate given the information known.

#### Example

This example demonstrates the Proportioned Amperage Rating approach described in Formula 5 below.

$$\text{Horsepower} = \frac{(\text{nameplate HP}) (\text{measured Amps})}{(\text{nameplate Amps})}$$

Motor = 5.00 hp (nameplate rating)  
 Nameplate Amps = 70.  
 Measured Amps: Phase 1 = 4.1  
                     Phase 2 = 4.4  
                     Phase 3 = 4.2

$$\begin{aligned} \text{Average Measured Amps} &= \frac{\text{Phase 1} + \text{Phase 2} + \text{Phase 3}}{3} \\ &= \frac{4.1 \text{ amps} + 4.4 \text{ amps} + 4.2 \text{ amps}}{3} \end{aligned}$$

**Average Measured Amps = 4.2 amps**

$$\begin{aligned} \text{Motor Load} &= \frac{(\text{Nameplate hp}) (\text{Average Measured Amps})}{(\text{Nameplate Amps})} \\ &= \frac{5 \text{ hp} \times 4.2 \text{ amps}}{7.0 \text{ amps}} \end{aligned}$$

**Motor Load = 3.00 hp Procedure**

B. The proper Low-Speed Service Factor is selected from Table 1 - Service Factors For Low-Speed Roller Chain Drive Conversions. The selection is based on the category of machinery being driven and the number of service hours per day.

#### Example

An Ore Conveyor is found in the Uniform Load drive group. Reading across to the right, the column heading for 16-24 hours daily service shows that a **1.3 Service Factor** is recommended.

#### Procedure

C. The Reducer Efficiency is available from the speed reducer name plate or manufacturers' catalogs. Often the speed reducer efficiency is not provided directly in manufacturer's catalog. In such cases the reducer efficiency must be calculated as described on page PT12-24.

#### Example - Speed Reducer Efficiency Calculation

Speed Reducer Rated Input Load hp = .65  
 Speed Reducer Rated Output Torque = lb-in. 6210  
 Speed Reducer Rated Output Speed rpm = 35  
 Rated Output hp

$$\begin{aligned} &= \frac{(\text{Rated Output Torque}) \times (\text{Output Speed})}{63025} \\ &= \frac{(6210 \text{ lb-in}) \times (35 \text{ rpm})}{63025} \end{aligned}$$

**Rated Output hp = 3.4**

$$\begin{aligned} \text{Reducer Efficiency} &= \frac{\text{Rated Output Power}}{\text{Rated Input Power}} \\ &= \frac{3.4 \text{ hp}}{6.5 \text{ hp}} \end{aligned}$$

**Reducer Efficiency = 0.53 or 53%**

#### Procedure

D. The Design Horsepower can now be determined by multiplying these three values together.

#### Example - Design Horsepower Calculation

Motor Load = **3.00 hp**  
 Low-Speed Service Factor = **1.3**  
 Reducer Efficiency = 53%  
 Horsepower = (Motorload)(Reducer Eff)  
 Horsepower = (3.00)(0.53) = 1.59

**Design Horsepower = (HP)(Low Speed Service Factor)**  
**Design Horsepower = (1.59)(1.3)**  
**Design Horsepower = 2.07**

## Low-Speed HT500 Belt Drive Selection Procedure

### Step 2 Select The Belt Pitch

#### Procedure

Using the Design Horsepower and the output speed of the speed reducer, select the belt pitch from the Belt Pitch Selection Guide Chart on page PT12-31.

#### Example

Design Horsepower = **2.07 hp**  
 Reducer Output Speed = **35 rpm**

Locate 35 rpm on the "RPM of Faster Shaft" scale on the left side of the chart and move over to where the 2.07 Design Horsepower line intersects. The intersection falls within the **8mm** pitch section, but a 14mm pitch belt could also be used.

### Step 3 Select The Sprockets and Belt Length

#### Procedure

**A. Determine the belt drive speed ratio:** The speed ratio can be calculated by dividing the speed (rpm) of the faster shaft by the speed (rpm) of the slower shaft.

#### Example

Reducer Output Speed = 35 rpm

Ore Conveyor Speed = 17.5 rpm

$$\text{Speed Ratio} = \frac{\text{rpm of faster shaft}}{\text{rpm of slower shaft}} = \frac{35}{17.5} = 2.00$$

**B. Select the sprocket combination and belt length:** Referring to the Stock Drive Selection Tables, find the proper set of tables for the belt pitch (8mm or 14mm) found in Step 2. Looking down the speed ratio column, find the value which most closely matches the belt drive speed ratio required. Reading across the selected speed ratio line, find the stock DriveR and DriveN sprocket combination available. Reading further across, locate the belt drive center distance which most closely matches the target center distance specified. The belt sizes are listed across the top of the table for each corresponding center distance.

Multiple sprocket combinations will often be available for a given speed ratio. In such cases, selection of the proper drive combination will depend on the center distance required, minimum or maximum required sprocket diameters and speed reducer overhung load requirements. After selecting possible sprocket combinations and center distances, record the belt length (top of column) and the length factor (bottom of column).

#### Example

Belt pitch = 14mm

Belt Drive Speed Ratio = 2.000

Center Distance = 50.00 ± 3.00 in. (from the problem statement)

Refer to the 14mm Pitch Stock Drive Selection Tables on pages PT12-63 - PT12-76. Reading down the Speed Ratio Column locate 2.000. In this case, there are five different drive combinations available for a 2.000 Speed Ratio. Checking the center distance values for each combination, the 50.10 inch value is the closest to the 50.00 inch target. So, the 28 teeth DriveR sprocket, 56 teeth DriveN sprocket, and 3136-14MX (224 teeth) belt combination is selected. Also note that the Belt Length Correction Factor is 1.12 with a center distance of 50.10 inches.

### Step 4 Select The Proper Belt Width Procedure

Horsepower Rating Tables are located on pages PT12-38 - PT12-46 for standard belt pitches and stock belt widths. The base horsepower rating is given in the upper table as a function of the speed (rpm) of the faster shaft and diameter of the small sprocket. The speed of the faster shaft is located in the left hand column. Across the top are various stock sprocket sizes. The base horsepower rating of a given sprocket, at a specific speed, is the point at which the "rpm" row and the "sprocket size" column intersect.

This basic horsepower rating must be corrected for speed down speed ratios, and for the belt length selected. The following formula should be used to calculate the total drive horsepower rating:

$$\text{Rated Drive Horsepower} = [\text{Rated Base Horsepower} + \text{Additional Horsepower for Speed Ratio}] \times (\text{Belt Length Correction Factor})$$

Referring to the Speed Ratio Add-On Factor Table, select a value based upon the drive operating speed and the speed ratio. This value should be added to the basic horsepower rating. Multiply the corrected rating by the applicable Belt Length Correction Factor determined in Step 3B or from the Belt Length Correction Factor Table. The corrected horsepower rating must equal or exceed design horsepower.

Where there are several choices, space limitations may control the selection. In addition, the following guidelines should be considered:

1. Larger sprockets result in reduced belt width.
2. Larger sprockets yield longer drive service life.
3. Avoid drives where the belt width exceeds the smaller sprocket diameter.
4. Avoid drives where center distance is greater than 8 times the diameter of the smaller sprocket.

#### Example

Referring to the 14mm pitch Horsepower Rating Table for 20mm Wide belts on page PT12-42. Read down the left hand column for "RPM of Faster Shaft" and locate 35 rpm. Read the sprocket sizes listed across the top of the table and locate the 28 teeth, 4.912 inch P.D. column. Read across the "RPM" row and down the sprocket size column until the two intersect at a **Rated Base Horsepower of 2.53 HP.**

Next, referencing the Speed Ratio Add-On Correction Table (page PT12-42), find the listing for a 2.000 speed ratio. An add-on factor of 0.11 hp is listed. Then, referencing the Belt Length Correction Factor Table (page PT12-72), find the listing for a 3136-14MX belt. A correction factor of 1.12 is listed.

## Low-Speed HT500 Belt Drive Selection Procedure

Calculate the Corrected Horsepower Rating:

Rated Drive Horsepower =

[Rated Base Horsepower + Added HP for Speed Ratio] x (Belt Length Correction Factor) = [2.53 hp + 0.11 hp] x (1.12)

**Rated Drive Horsepower 2.96 hp**

The Corrected Horsepower Rating of 2.96 hp exceeds the Design Horsepower target of 2.07 hp. So, a **belt width of 20mm** is acceptable.

### Step 5 Check and Specify Stock Drive Components

#### Procedure

**A. Check the sprockets selected against any special design requirements** using the dimensions provided in the Sprocket Specifications Tables on pages PT12-6 - PT12-13. Use flange diameters when checking against maximum diameter requirements.

**B. Determine the bushing size required for each sprocket and check bore sizes** by using the Sprocket Specification Tables. From the Stock Bushing tables in the bushing section, check the bore range and keyway dimensions against the design requirements.

#### Example

Also from the sprocket data on page PT12-9 we note that the **14MX-28S-20 sprocket** requires a 2012 bushing and the **14MX-56S-20 sprocket** requires a 3525 bushing. On page PT12-81 in the bushing data table, a **2012 bushing has a bore range of 1/2 to 2-1/8 inches**, which includes the 1-1/2 inch bore required for the driveR shaft. The **3525 bushing has a bore range from 1-3/16 to 3-15/16 inches** page PT12-83, which includes the 2 inch bore required for the driveN shaft.

**C. Specify stock drive components using proper designations.**

#### Example

Stock drive components are as follows:

- 1 ea. - 3136-14MX-20 HT500 belt
- 1 ea. - 14MX-28S-20 driveR sprocket
- 1 ea. - 2012 Bushing with a 1-1/2 in. bore
- 1 ea. - 14MX-56S-20 driveN sprocket
- 1 ea. - 3525 Bushing with a 2 in. bore

### Step 6 Installation and Take-up

#### Procedure

Because of its high resistance to elongation (stretch), there is no need to re-tension and take-up a HT500 belt drive. However, some adjustment must be provided when installing synchronous belt drives, as with nearly all power transmission systems, due to manufacturing and assembly tolerances and initial tensioning requirements. Table 11 on page PT12-36 lists the standard installation and take-up requirements for a given belt length. Additional center distance adjustment is needed when installing the belt over flanged sprockets (see Table 11 on page PT12-36.)

#### Example

As can be seen in the Sprocket Specifications Table on page PT12-9, both of the sprockets are flanged. Therefore, an additional allowance will be needed for installation over flanged sprockets. The total installation and tensioning allowances, are shown below.

**Installation Allowance = 0.16 in. + 1.97 in. = 2.13 in.**

**Tensioning Allowance = 0.05 in.**

Subtracting this from the nominal center distance value gives a minimum center distance necessary for belt installation of (50.10 inch - 2.13 inch) = 47.97 inches. From the problem statement, the center distance can be reduced down to 47.0 in. if needed. So, there is sufficient center distance adjustment to easily install the belt.

### Step 7 Calculate Belt Tensioning Requirements

#### Procedure

**A. Calculate base static tension** using Formula 14 on page PT12-35. The m value is listed in Table 10 on page PT12-34.

#### Example

Belt Pitch = 14mm  
 Belt Size = 3136-14MX, 224 teeth (123.46 in. P.L.)  
 Belt Width = 20mm  
 DriveR Sprocket = 28 teeth (4.912 in. P.D.)  
 DriveR Shaft Speed = 35 rpm  
 DriveN Sprocket = 56 teeth (9.825 in. P.D.)  
 Actual Center Distance = 50.10 in.  
 Design Horsepower = 2.07 hp  
 Horsepower = 1.59 hp

$$T_{st} = \frac{20 \text{ DHP}}{S} + mS^2, \text{ pounds}$$

where:

DHP = Design Horsepower = 1.59 hp

m = 0.92, constant for 14mm pitch, 20mm wide belt from Table 10 on page PT12-34.

S = (Sprocket Diameter) x (Shaft Speed) / 3820  
 = (4.912 in.) x (35 rpm) / 3820

**S = 0.05**

$$T_{st} = \frac{20(1.59)}{0.05} + (0.92)(0.05)^2$$

Tst = 636.00 + 0.002 lb.

**Tst = 636.00 lb.**

## Low-Speed HT500 Belt Drive Selection Procedure

### Step 7 Calculate Belt Tensioning Requirements

Procedure — continued

B. Calculate minimum and maximum deflection forces using Formulas 15 and 16 on page PT12-35. The Y value is listed in Table 10 on page PT12-34.

**Example**

a. Calculate the belt span length

$$t = \sqrt{C^2 - \left(\frac{D-d}{2}\right)^2}$$

where:

t = Span Length, inches

C = Center Distance = **50.10 in.**

D = diameter of larger sprocket = **9.825 in. P.D.**

d = diameter of smaller sprocket = **4.912 in. P.D.**

$$t = \sqrt{50.10^2 - \left(\frac{9.825 - 4.912}{2}\right)^2}$$

**t = 50.04 in.**

b. Calculate Minimum and Maximum belt deflection forces referring to Formulas 15 and 16 on page PT12-35:

$$\text{Min Deflection Force} = \frac{1.1st + \left(\frac{t}{L}\right)Y}{16} \text{ pounds}$$

where:

$T_{ST} = 636.0$  pounds static tension as calculated above

t = **50.04** inches span length as calculated above

L = **123.46** inches belt length

Y = **230** (constant for Y, Table 10 on page PT12-34)

$$\text{Min Deflection Force} = \frac{1.1(636.0) + \left(\frac{50.04}{123.46}\right)(230)}{16}$$

**Min. Deflection Force = 49.5 lb.**

$$\text{Max Deflection Force} = \frac{1.2T_{st} + \left(\frac{t}{L}\right)Y}{16}$$

$$\text{Max Deflection Force} = \frac{1.2(636.0) + \left(\frac{50.04}{123.46}\right)(230)}{16}$$

**Min. Deflection Force = 53.5 lb.**

C. Determine the deflection distance using 1/64" per inch of span length.

**NOTE: Deflection forces must be applied evenly across the entire belt width.**

**Example**

$$\text{Deflection Distance} = \frac{t}{64}, \text{ inches}$$

$$\text{Deflection Distance} = \frac{50.04}{64}$$

**Deflection Distance = 0.78**

**D. Applying The Tension:**

At the center of span (t), apply a force perpendicular to the belt span large enough to deflect the belt 0.78 inch from its normal free position. Be sure that the force is applied evenly across the entire belt width. Note that one sprocket should be free to rotate during the belt tensioning process.

Compare the measured deflection force with the range of minimum to maximum deflection forces calculated previously.

1. If the measured deflection force is less than the minimum recommended deflection force, the belt should be tightened.

2. If the measured deflection force is greater than the maximum recommended deflection force, the belt should be loosened.

**Example**

When the Ore Conveyor belt drive is properly tensioned, a belt span deflection of 0.78 in. should require a deflection force within the range of 49.5 to 53.5 lb.

**Step 8 Verify Speed Reducer Overhung Load**

**Procedure**

An Overhung Load calculation verifies that the belt drive system will not overload the speed reducer shaft and bearings. The Overhung Load calculation for speed reducers varies from manufacturer to manufacturer. Please refer to speed reducer catalogs or contact the speed reducer manufacturer for further assistance.

# SELECTION

## Low-Speed HT500 Belt Drive Selection Procedure Advantages of the Low-Speed Drive Design Procedure

Having read through the Low-Speed Drive Design Procedure and example, some may wonder if the extra steps required are really worth the effort. Absolutely! Using the low-speed drive design techniques for drives operating at speeds less than 500 rpm can result in a much smaller drive package at a lower cost. Outlined below is a comparison of the Low-Speed Drive Design Procedure with the traditional drive design procedure. The benefits of designing with a Low Speed Service Factor, Actual Horsepower Load, and Speed Reducer Efficiency are demonstrated. Combining these techniques can result in a substantially narrower belt drive width which saves space and reduces cost.

### Comparison 1 — Traditional Drive Design Procedure

The traditional drive design procedure is outlined on pages PT12-28 - PT12-31 and should still be used for belt drives operating at speeds greater than 500 rpm. In the past this procedure was used to select all HT500 belt drives. The new “Low-Speed Drive Design Procedure” results in belt drive systems better sized for low speed power transmission system that typically utilize speed reducers and roller chain.

Using the traditional design procedure to select the belt drive system for the Ore Conveyor example would result in a much wider belt. The traditional design procedure does not account for a low-speed service factor, the actual operating load of the motor, or speed reducer efficiency. Rather, the belt selection is based purely on the name plate horsepower rating of the motor with a standard service factor. For the Ore Conveyor example this would mean a 5 hp name plate rating and a 1.7 service factor resulting in a Design Horsepower for the belt drive of  $(5.00 \text{ hp}) \times (1.7) = 8.50 \text{ hp}$ . This is over 4 times the Design Horsepower of 2.07 hp determined using the Low-Speed Drive Design Procedure. Referring to the Horsepower Rating Tables on pages PT12-38 - PT12-46, **a belt width of 68mm is required for this higher 8.50 Design Horsepower Load using the Traditional Design Method compared to a belt width of only 20mm for the 2.07 Design Horsepower Load using the Low-Speed Design Method.**

### Comparison 2 — Benefit of Low-Speed Service Factor

Using a low-speed service factor can reduce the required belt width compared to a standard service factor value. The reason for this is directly related to belt drive operating speeds. Detrimental effects such as belt tensile cord fatigue and belt wear both occur during belt drive operation, but accumulate in direct proportion to the operating speed. Lower operating speeds result in less belt damage over time allowing the use of less severe service factors in the belt drive selection process. Service factors especially for belt drives operating at low speeds (500 rpm and less; includes many roller chain applications) are provided in Table 1—Service Factors For Low-Speed Roller Chain Drive Conversions on page PT12-19.

Referring to the Ore Conveyor Example, a low-speed service factor of 1.3 is recommended for this application. Substituting the reduced 1.3 low-speed service factor: Design Horsepower =  $(5.00 \text{ hp}) \times (1.3) = 6.50 \text{ hp}$ . Referring to the Horsepower Rating Tables on pages PT12-38 - PT12-46, **the belt width required for 6.50 Design Horsepower is 68mm.**

### Comparison 3—Benefit of Designing with Actual Motor Load

Typical belt drive selections are based upon motor nameplate horsepower ratings. However, industry surveys estimate that half of all U.S. motors operate at less than 60 percent of their rated load, and one third operate at below 50 percent of their rated load. So, sizing belt drives based on true operating loads can result in a more compact sized belt drive system.

Continuing with the Ore Conveyor Example, the Proportioned Amperage Rating approach was used to calculate a Motor Load of 3.00 hp. Substituting the reduced 3.00 hp motor load: Design Horsepower =  $(3.00 \text{ hp}) \times (1.3) = 3.90 \text{ hp}$ . Referring to the Horsepower Rating Tables on pages PT12-38 - PT12-46, **the belt width required for 3.90 Design Horsepower is only 37mm compared to the 68mm belt width required in Comparison 2.**

| DriveR      |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |
|             |   |   |                 |       |                |                |     |               |       |            |        |                |

Note: For complex drive layouts use additional pages as needed

## HT500 Drive Selection Procedure (Continued)

1. Calculate the Design Horsepower
2. Select the Belt Pitch
3. Select the Sprockets And Belt Length
4. Select the Proper Belt Width
5. Check and Specify Stock Drive Component
6. Installation and Take-up
7. Calculate Belt Tensioning Requirements

### Step 3 Select The Sprockets and Belt Length Procedure

A. Determine the speed ratio: The speed ratio can be calculated by dividing the rpm of the faster shaft by the rpm of the slower shaft.

#### Example

Motor Speed = 1160 rpm  
Gear Pump Speed = 580 rpm

$$\text{Speed Ratio} = \frac{\text{rpm of faster shaft}}{\text{rpm of slower shaft}} = \frac{1160}{580} = 2.00$$

B. Select the sprocket combination and belt length: Referring to the Stock Drive Selection Tables on pages PT12-47 - PT12-76, find the proper set of tables for the belt pitch (8mm or 14mm) found in Step 2. Looking down the speed ratio column, find the value which most closely matches the belt drive speed ratio required. Reading across the selected speed ratio line, find the stock DriveR and DriveN sprocket combination available. Reading further across, locate the belt drive center distance which most closely matches the target center distance specified. The belt sizes are listed across the top of the table for each corresponding center distance.

Multiple sprocket combinations will often be available for a given speed ratio. In such cases, selection of the proper drive combination will depend on the center distance required, minimum or maximum required sprocket diameters and the recommended minimum sprocket diameter for electric motors (see Table 4 on page PT12-32).

After selecting possible sprocket combinations and center distances, record the belt length (top of column) and the length factor (bottom of column).

#### Example

Belt pitch = 8mm and 14mm  
Belt Drive Speed Ratio = 2.00  
Center Distance = 30.00 ± 3.00 in.

First, refer to the 8mm Pitch Stock Drive Selection Tables on pages PT12-47 - PT12-76. Reading down the Speed Ratio column locate 2.00 on page PT12-57. There are six various sprocket combinations within the allowable center distance range. Of these, two are closest to the desired 30 inches. These are 25 to 50 teeth, and 40 to 80 teeth sprocket combinations. The minimum sprocket diameter of 6.1 inches for a 30 hp motor at 1160 rpm (See Table 4 on page PT12-32) eliminates the 25 to 50 and 40 to 80 teeth sprocket combinations. Therefore, an 8mm pitch drive will not be utilized for this drive system.

Now refer to the 14mm Pitch Stock Drive Selection Tables on pages PT12-63 - PT12-76. Reading down the Speed Ratio Column locate 2.00 on page PT12-71. Several combinations are shown which will meet the 30 ± 3 inch center distance requirement. The maximum O.D. limit of 18 inches on the driveN sprocket eliminates the 56 to 112 teeth combination. The preference for a center distance close to 30 inches would favor the 40 to 80 and 28 to 56 teeth combinations. However, the 4.912 inch pitch diameter of the 28 teeth sprocket is less than the recommended minimum diameter of 6.1 inches for the electric motor. So the 40 teeth DriveR sprocket, 80 teeth DriveN sprocket, and 2380-14MX (170 teeth) belt combination is selected. Also note that the Belt Length Correction Factor is 1.01 with a center distance of 30.11 inches.

### Sample Drive Selection Problem

A gear pump is to be driven by a 30 hp normal torque electric motor with an output speed of 1160 rpm. The gear pump is to be driven at 580 rpm ±5%. The center distance is to be approximately 30 inches, but can be altered ±3 inches, if necessary. The motor shaft has a 2 1/8 inch O.D. and the pump shaft has a 3 inch O.D. The pump will operate 16 hours a day, five days a week. The pump sprocket is limited to a maximum of 18 inches O.D. There are no unusual drive conditions. Design using HT500.

### Step 1 Calculate The Design Horsepower

#### Procedure

To calculate the design horsepower, first determine the relative severity, then select a service factor for the drive. Average hours per day of service also should be considered. Locate the power source and the driveN unit in the Service Factor Table on page PT12-33. The design hp then is determined by multiplying the rated hp (usually the nameplate rating) by the service factor determined above.

#### Example

Using the Service Factor Table, the driveR can be found in the first group. Since the pump will run 16 hours per day, follow the continuous service column down to the driveN machines group for gear pumps. The recommended Service Factor is 1.7.

$$\begin{aligned} \text{Design Horsepower} &= (\text{Motor Load}) \times (\text{Service Factor}) \\ &= (30) \times (1.7) \end{aligned}$$

$$\text{Design Horsepower} = 51 \text{ hp}$$

### Step 2 Select The Belt Pitch

#### Procedure

Using the design hp and the rpm of the smaller sprocket, select the belt pitch from the Belt Pitch Selection Guide on page PT12-31.

#### Example

Design Horsepower = 51 hp  
Motor Speed = 1160 rpm

Locate 1160 rpm on the "RPM of Faster Shaft" scale on the left side of the chart and move over to where the 51 Design Horsepower line intersects. The intersection falls within the 8mm pitch range, but near the 14mm pitch area. Both 8mm and 14mm pitch drives should be considered.

## HT500 Drive Selection Procedure (Continued)

C. Check the belt speed. Do not exceed 6500 fpm (feet per minute) with stock sprockets. Belt Speed can be calculated using the following formula:

$$V \text{ (fpm)} = PD \text{ (inches)} \times \frac{\text{Speed (rpm)}}{3.82}$$

### Example

14mm Pitch Drive with 40 groove driveR:

$$V = \frac{7.018 \times 1160}{3.82} = 2131.1 \text{ fpm}$$

Calculating the belt speed for the drive system being considered shows that the belt speed does not exceed 6500 fpm and can be considered further.

### Step 4 Select The Proper Belt Width

#### Procedure

Horsepower Rating Tables are located on Pages PT12-38 - PT12-46 for standard belt pitches and stock belt widths. The base horsepower rating is given in the upper table as a function of the speed (rpm) of the faster shaft and diameter of the small sprocket. The speed of the faster shaft is located in the left hand column. Across the top are various stock sprocket sizes. The base horsepower rating of a given sprocket, at a specific speed, is the point at which the "rpm" row and the "sprocket size" column intersect.

This base horsepower rating must be corrected for speed down speed ratios, and for the belt length selected. The following formula should be used to calculate the total drive horsepower rating:

$$\text{Rated Drive Horsepower} = [\text{Rated Base Horsepower} + \text{Additional Horsepower for Speed Ratio}] \times (\text{Belt Length Correction Factor})$$

Referring to the Additional Horsepower for Speed Ratio Factor Table, select a value based upon the drive operating speed and the speed ratio. This value should be added to the base horsepower rating. Multiply the corrected rating by the applicable Belt Length Correction Factor determined in Step 3B or from the Belt Length Correction Factor Table. The drive horsepower rating must equal or exceed design horsepower.

Where there are several choices, space limitations may control the selection. In addition, the following guidelines should be considered:

1. Larger sprockets result in reduced belt width.
2. Larger sprockets yield longer drive service life.
3. Avoid drives where the belt width exceeds the smaller sprocket diameter.
4. Avoid drives where center distance is greater than 8 times the diameter of the smaller sprocket.

### Example

Refer to the 14mm pitch Horsepower Rating Table for 20mm Wide belts on page PT12-42. Read down the left hand column for "RPM of Faster Shaft" and locate 1160 rpm. Read the sprocket sizes listed across the top of the table and locate the 40 teeth, 5.614 inch P.D. column. Read across the "RPM" row and down the sprocket size column until the two intersect at a **Rated Base Horsepower of 60.0 hp**.

Next, referencing the Additional Horsepower for Speed Ratio Factor Table, find the listing for a 2.00 speed ratio. An **add-on factor of 3.53 hp** is listed. Then, referencing the Belt Length Correction Factor Table, find the listing for a 2380-14MX belt. A **correction factor of 1.01** is listed.

Calculate the Corrected Horsepower Rating:  
 Rated Drive Horsepower =  
 [Rated Base Horsepower + Added HP for Speed Ratio] x  
 (Belt Length Correction Factor) = [60.0 hp + 3.53 hp] x (1.01)

**Rated Drive Horsepower = 64.17 hp**

The Drive Horsepower Rating of 64.17 hp exceeds the Design Horsepower target of 51 hp. So, a belt width of 20mm is acceptable.

### Step 5 Check and Specify Stock Drive Components

#### Procedure

A. Check the sprockets selected in Steps 3 and 4 against the design requirements using the dimensions provided in the Sprocket Specification Tables on pages PT12-6 - PT12-13. Use flange diameters when checking against maximum diameter requirements.

#### Example

From the table on page PT12-9, we find the 14MX-80S-20 driveN Sprocket has an overall flange diameter of 14.620 inches, which is less than the 18 inch maximum diameter specified.

B. Determine the bushing size required for each sprocket and check bore sizes by using the Sprocket Specification Tables. From the Stock Bushing tables on pages PT12-80 - PT12-85, check the bore range and keyway dimensions against the design requirements.

#### Example

Also from the sprocket data on page PT12-9 we note that the 14MX-40S-20 sprocket requires a 2517 bushing and the 14MX-80S-20 sprocket requires a 3525 bushing. In the bushing table on pages PT12-81 - PT12-83, a 2517 bushing has a bore range of 1/2 to 2-11/16 inches, which includes the 2-1/8 inch bore required for the driveR shaft. The 3525 bushing has a bore range from 1-3/16 to 3-15/16 inches, which includes the 3 inch bore required for the driveN shaft.

C. Specify stock drive components using proper designations.

#### Example

Stock drive components are as follows:  
 1 ea. 2380-14MX-20 HT500 belt  
 1 ea. 14MX-40S-20 driveR sprocket  
 1 ea. 2517 Bushing with a 2-1/8 in. bore  
 1 ea. 14MX-80S-20 driveN sprocket  
 1 ea. 3525 Bushing with a 3 in. bore

## HT500 Drive Selection Procedure (Continued)

### Step 6 Installation and Takeup

#### Procedure

Because of its high resistance to elongation (stretch), there is no need to re-tension and take up a HT500 belt drive. However, some adjustment must be provided when installing synchronous belt drives, as with nearly all power transmission systems, to account for manufacturing and assembly tolerances and initial tensioning requirements. Table 11 on page PT12-36 lists the standard installation and take-up requirements for a given belt length. Additional center distance adjustment is needed when installing the belt over flanged sprockets (see Table 11 on page PT12-36.)

#### Example

As can be seen in the Sprocket Specifications Table on page PT12-9, both of the sprockets are flanged. Therefore, an additional allowance will be needed for installation over flanged sprockets. The total installation and tensioning allowances, are shown below.

Installation Allowance = 0.13 in. + 1.97 in. = 2.10 in

Tensioning Allowance = 0.04 in.

Subtracting this from the nominal center distance value gives a minimum center distance necessary for belt installation of (30.11 inch - 2.10 inch) = 28.10 inches. From the problem statement, the center distance can be reduced down to 27.0 in. if necessary. So, there is sufficient center distance adjustment to easily install the belt.

### Step 7 Calculate Belt Tensioning Requirements

#### Procedure

A. Calculate base static tension using appropriate Formula 14 on page PT12-34. The m value is listed in Table 10 on page PT12-34.

#### Example

Belt Pitch = 14mm  
 Belt Size = 2380-14MX, 170 teeth (93.70 in. P.L.)  
 Belt Width = 20mm  
 DriveR Sprocket = 40 teeth (7.018 in. P.D.)  
 DriveR Shaft Speed = 1160 rpm  
 DriveN Sprocket = 80 teeth (14.036 in. P.D.)  
 Actual Center Distance = 30.11 in.  
 Design Horsepower = 51 hp

$$TST = \frac{20 \text{ HP}}{S} + mS2, \text{ pounds}$$

Where:

HP = Horsepower = 30 hp  
 m = 0.92, constant for 14mm pitch, 20mm wide belt from Table 10 on page PT12-34  
 $S = (\text{Sprocket Diameter}) \times (\text{Shaft Speed}) / 3822.76$   
 $= (7.018 \text{ in.}) \times (1160 \text{ rpm}) / 3822.76$   
 $S = 2.13$

$$TST = \frac{20(30)}{2.13} + (0.92)(2.13)^2$$

$$TST = 281.69 + 4.17 \text{ lb.}$$

$$TST = 285.86 \text{ lb.}$$

B. Calculate minimum and maximum deflection forces using Formulas 15 and 16 on page PT12-35. The Y value is listed in Table 10.

#### Example

a. Calculate the belt span length

$$t = \sqrt{C^2 - \left(\frac{D-d}{2}\right)^2}$$

where:

t = Span Length, inches

C = Center Distance = 30.11 in.

D = diameter of larger sprocket = 14.036 in. P.D.

d = diameter of smaller sprocket = 7.018 in. P.D.

$$t = \sqrt{30.11^2 - \left(\frac{14.036 - 7.018}{2}\right)^2}$$

b. Calculate Minimum and Maximum belt deflection forces referring to Formulas 15 and 16 on page PT12-35:

$$\text{Min Deflection Force} = \frac{1.1st + \left(\frac{t}{L}\right)Y}{16}$$

16

where:

TST = 285.86 pounds static tension as calculated before

t = 29.90 inches span length as calculated before

L = 93.70 inches belt length

Y = 230 (constant for Table 10 on page PT12-34)

$$\text{Min Deflection Force} = \frac{1.1(285.86) + \left(\frac{29.90}{93.70}\right)(230)}{16}$$

Min. Deflection Force = 24.24 lb.

$$\text{Max Deflection Force} = \frac{1.2Tst + \left(\frac{t}{L}\right)Y}{16}$$

$$\text{Max Deflection Force} = \frac{1.2(685.86) + \left(\frac{29.90}{93.70}\right)(230)}{16}$$

Max. Deflection Force = 26.03 lb.

## HT500 Drive Selection Procedure (Continued)

### Step 7 Calculate Belt Tensioning Requirements

#### Procedure - continued

C. Determine the deflection distance using 1/64" per inch of span length.

**NOTE:** Deflection forces must be applied evenly across the entire belt width.

#### Example

$$\text{Deflection Distance} = \frac{t}{64}, \text{ inches}$$

$$\text{Deflection Distance} = \frac{29.9}{64}$$

### D. Applying The Tension:

At the center of span (t), apply a measured force perpendicular to the belt span large enough to deflect the belt 0.47 inch from its normal free position. Be sure that the force is applied evenly across the entire belt width. Note that one sprocket should be free to rotate during the belt tensioning process.

Compare the measured deflection force with the range of minimum to maximum deflection forces calculated before.

1. If the measured deflection force is less than the minimum recommended deflection force, the belt should be tightened.
2. If the measured deflection force is greater than the maximum recommended deflection force, the belt should be loosened.

#### Example

When the Gear Pump belt drive is properly tensioned, a belt span deflection of 0.47 in. should require a deflection force within the range of 22.34 to 24.12 lb.

Belt Pitch Selection Guide

## Table 4 Minimum Recommended Sprocket Pitch Diameters for General Purpose Electric Motors Synchronous Belt Drives

For a given motor horsepower and speed, the total belt pull is related to the motor sprocket size. As this size decreases, the total belt pull increases. Therefore, to limit the resultant load on motor shaft and bearings, NEMA lists minimum sprocket sizes for the various motors. The sprocket on the motor (DriveR sheave) should be at least as large as the diameter specified in Table No. 4.

| Motor Horsepower | Motor RPM (60 Cycle and 50 Cycle Electric Motors) |             |             |              |               |               | Motor Horsepower |
|------------------|---|-------------|-------------|--------------|---------------|---------------|------------------|
|                  | 575<br>485*                                       | 690<br>575* | 870<br>725* | 1160<br>950* | 1750<br>1425* | 3450<br>2850* |                  |

## Standard Belt Tensioning Procedure

When installing a belt:

- Be sure it is tensioned adequately to prevent tooth jumping (ratcheting) under the most severe load conditions which the drive will encounter during operation.
- Avoid extremely high tension which can reduce belt life and possibly damage bearings, shafts and other drive components.

The proper way to check belt tension is to use a tension tester. Baldor has a variety of tension testers, ranging from the simple spring scale type tester to the sophisticated Sonic Tension Meter. The spring scale type tester is used by measuring how much force is required to deflect the belt at the center of his span by a specified distance (force deflection method), as shown in the sketch below.

The Sonic Tension Meter measures the vibration of the belt span and instantly converts the vibration frequency into belt static tension (span vibration method).

When you wish to use a numerical method for calculating recommended belt installation tension values, the following procedure may be used.

STEP 1: Calculate the required base static installation tension.

Use Formula 14 to calculate the required base static installation tension.

#### Formula 14

$$T_{si} = \frac{20HP}{S} + mS^2$$

Where  $T_{si}$  = base static installation tension, pounds  
 HP = Horsepower  
 $S = \frac{PD \times RPM}{3820}$   
 m = Value from table 10  
 PD = Sprocket Pitch Diameter, inches  
 RPM = Revolutions per minute of same sprocket

Table 10

| Pitch | Belt Width | m    | Y    | minimum $T_{si}$ (lb)<br>per span |
|-------|------------|------|------|-----------------------------------|
| 8mm   | 12mm       | 0.33 | 65   | 28                                |
|       | 21mm       | 0.57 | 113  | 49                                |
|       | 36mm       | 0.97 | 194  | 84                                |
|       | 62mm       | 1.68 | 335  | 145                               |
| 14mm  | 20mm       | 0.92 | 230  | 119                               |
|       | 37mm       | 1.69 | 426  | 220                               |
|       | 68mm       | 3.11 | 782  | 405                               |
|       | 90mm       | 4.12 | 1035 | 536                               |
|       | 125mm      | 5.72 | 1438 | 744                               |

# SELECTION

Because of the high performance capabilities of HT500 belts, it is possible to design drives that have significantly greater load than are necessary to carry the actual design load. Consequently, Formula 14 can provide  $T_{st}$  values less than are necessary for the belt to operate properly, resulting in poor belt performance and reduced service life. If a more appropriately sized drive cannot be designed, minimum recommended  $T_{st}$  values are provided in Table 10 to assure that the belts function properly when lightly loaded.

Always use the greater  $T_{st}$  value; i.e., from  $T_{st}$  Formula 14 or Table 10.

**NOTE:** When applying static belt tension values directly, multiply the required base static installation tension ( $T_{st}$ ) calculated in Formula 14 by the following factors:

For New Belts:

$$\begin{aligned} \text{Minimum Static Tension} &= \text{Base Static Tension} \times 1.1 \\ \text{Maximum Static Tension} &= \text{Base Static Tension} \times 1.2 \end{aligned}$$

For Used Belts:

$$\begin{aligned} \text{Minimum Static Tension} &= \text{Base Static Tension} \times 0.8 \\ \text{Maximum Static Tension} &= \text{Base Static Tension} \times 0.9 \end{aligned}$$

## STEP 2: Calculate the minimum and maximum recommended deflection forces.

- Measure the span length of your drive (see sketch).
- New belt minimum recommended force:

### Formula 15

$$\text{deflection force, Min} = \frac{1.1 T_{st} + \left(\frac{t}{L}\right) Y}{16}, \text{lb}$$

### Formula 16

$$\text{deflection force, Max} = \frac{1.2 T_{st} + \left(\frac{t}{L}\right) Y}{16}, \text{lb}$$

Where:

- $T_{st}$  = Base Static tension, lbf
- $t$  = span length, inches
- $L$  = belt pitch length, inches
- $Y$  = constant from Table 10

**USED BELT NOTE:** For re-installation of a used belt, a recommended tension of  $0.8 T_{st}$  to  $0.9 T_{st}$  value should be used in calculating the deflection forces, instead of the  $1.1 T_{st}$  to  $1.2 T_{st}$  shown for new belts.

## STEP 3: Applying the tension

### Force deflection tension method

**A.** At the center of the span ( $t$ ) apply a force perpendicular to the span large enough to deflect the belt on the drive  $1/64$  inch per inch of span length from its normal position. One sprocket should be free to rotate. Be sure the force is applied evenly across the entire belt width. If the belt is a wide synchronous belt, place a piece of steel or angle iron across the belt width and deflect the entire width of the belt evenly.

**B.** Compare this deflection force with the range of forces calculated in Step 2.

- If it is less than the minimum recommended deflection force, the belt should be tightened.
- If it is greater than the maximum recommended deflection force, the belt should be loosened.

### Span vibration tension method

The Sonic Tension Meter detects the vibration frequency in the belt span, and converts that measurement into the actual static tension in the belt.

To use the Sonic Tension Meter, begin by entering the belt unit weight, belt width, and the span length. To measure the span vibration, press the "Measure" button on the meter, tap the belt span, and hold the microphone approximately  $1/4$ " away from the back of the belt. The Sonic Tension Meter will display the static tension, and can also display the span vibration frequency.

The belt unit weights for use with the Sonic Tension Meter are shown in the following table.

| Belt Product Family | Belt Cross section | Adjusted Belt Weight (grams/meter) |
|---------------------|--------------------|------------------------------------|
| HT500 Belt          | 8mm                | 4.7                                |
|                     | 14mm               | 7.9                                |

### Rim Speed Limits per MPTA Standard

| Product Material   | Maximum allowable RIM speed in FPM |             |
|--------------------|------------------------------------|-------------|
|                    | Web / Arm Style                    | Block Style |
| Class 30 Gray Iron | 6500                               | 7500        |
| Ductile Iron 65    | 8000                               | 10000       |
| Ductile Iron 80    | 10000                              | 13000       |
| Steel (1018)       | 9000                               | 11000       |

$$(\text{FPM} = .626 \times \text{Dia. (inches)} \times \text{RPM})$$

**NOTE:** Above rim speed values are maximum for normal considerations. In some cases these values may be exceeded. Consult factory and include complete details of proposed application.

$$\text{Dynamic balance RPM} = \frac{15600}{\sqrt{\text{Dia} \times \text{Face Width}}}$$

for Sheave/Sprocket  $\diamond$

$\diamond$  Note: MPTA recommends Dynamic balance when application RPM exceeds this value

## Center Distance Allowances for Installation and Tensioning

Since fixed center drives are not recommended, center distance allowances for a HT500 belt drive are necessary to assure that the belt can be installed without damage and then tensioned correctly. The standard installation allowance is the minimum decrease in center distance required to install a belt when flanged sprockets are removed from their shafts for belt installation. This is shown in the first column of Table 11. This table also lists the minimum increase in center distance required to assure that the belt can be properly tensioned over its normal life time. If a belt is to be installed over flanged sprockets without removing them, the additional center distance allowance for installation shown in the second table below must be added to the first table data.

**Table 11**

Center Distance Allowance For Installation and Tensioning

| Belt Length (mm) (In)                         | Standard Installation Allowance (Flanged Sprocket removed for installation) (mm) (In) | Tension Allowance (mm) (In) |
|---|---|-----------------------------|
| up to 125<br><b>5</b>                         | 0.5<br><b>0.02</b>  | 0.5<br><b>0.02</b>          |
| over 125 to 250<br><b>5</b> to <b>10</b>      | 0.8<br><b>0.03</b>  | 0.8<br><b>0.03</b>          |

Additional Center Distance Allowance For Installation Over Flanged Sprockets\*  
(Add to Installation Allowance in table No 11)

| Pitch | One Sprocket Flanged (mm) (In) | Both Sprockets Flanged (mm) (In) |
|-------|--------------------------------|----------------------------------|
| 8mm   | 21.8<br><b>0.86</b>            | 33.3<br><b>1.31</b>              |
| 14mm  | 31.2<br><b>1.23</b>            | 50.0<br><b>1.97</b>              |

\*For drives that require installation of the belt over one sprocket at a time, use the value for "Both Sprockets Flanged"

## Drive alignment

Provision should be made for center distance adjustment, according to the two tables on this page, or to change the idler position so the belt can be slipped easily onto the drive. When installing a belt, never force it over the flange. This will cause internal damage to the belt tensile member.

Synchronous belts typically are made with high modulus tensile members which provide length stability over the belt life. Consequently, misalignment does not allow equal load distribution across the entire belt top width. In a misaligned drive, the load is being carried by only a small portion of the belt top width, resulting in uneven belt wear and premature tensile failure.

There are two types of misalignment: parallel and angular (See Fig.7). Parallel misalignment is where the driveR and driveN shafts are parallel, but the two sprockets lie in different planes. When the two shafts are not parallel, the drive is angularly misaligned.

A fleeting angle is the angle at which the belt enters and exits the sprocket, and equals the sum of the parallel and angular misalignments.

Any degree of sprocket misalignment will result in some reduction of belt life, which is not accounted for in the normal drive design procedure. Misalignment of all synchronous belt drives should not exceed 1/4" or 1/16" per foot of linear distance. Misalignment should be checked with a good straight edge or by using a laser alignment tool. The straight edge tool should be applied from driveR to driveN, and then from driveN to driveR so that the total effect of parallel and angular misalignment is made visible.

**Figure 7**

Drive misalignment can also cause belt tracking problems. However, light flange contact by the belt is normal and won't affect performance.

For those drives in which the center distance is greater than eight times the small sprocket diameter, belt tracking can be a problem. In these cases, the parallel position of the two sprockets may need to be adjusted until only one flange guides the belt in the system and the belt tracks fully on all sprockets. Regardless of the drive center distance, the optimum drive performance will occur with the belt lightly contacting one flange in the system. The worst case is for the belt to contact flanges on opposite sides of the system. This traps the belt between opposite flanges and can force the belt into undesirable parallel misalignment.

Center distance is greater than eight times the small sprocket and the large sprocket is not flanged. See Engineering Section for details.  
 \* The length correction factor must be used to determine the proper belt width.

# SELECTION

## Overhung Load Calculations

Overhung load is an important consideration for drive design. Motor and reducer bearings are rated for specific load capacities to achieve calculated life. If the drive design is such that bearing loads are exceeded, life will be proportionally reduced. Likewise, if the drive exerts a lesser load on the bearings, life will be extended. Needless to say, drive design that keeps bearing loads below ratings can pay big dividends.

**BELT PULL:** The basis for overhung load calculation is belt pull. Belt pull is the result of torque being transmitted when the belt exerts a pull on the sprocket diameter.

**EXAMPLE:** 5 hp at 200 RPM is 1,575 inch-pounds of torque. If a 6" diameter sprocket is used, (3 inch radius),  $1,575/3 = 525$  pounds effective belt pull is required. Note that if a larger diameter sprocket is used, belt pull is reduced accordingly.

Belt pull can be calculated using the following formula:

$$\text{Belt Pull (lbs)} = \frac{126,000 \times \text{HP} \times F}{\text{RPM} \times \text{PD}}$$

Where: HP = Name plate horsepower of the motor or driver

F = Drive Factor (1.3 for synchronous belt)

RPM = Shaft RPM

PD = Pitch Diameter of Sprocket

**BEARING LOAD:** Belt pull translates into bearing load and is greatly affected by the location of the sprocket on the shaft. Fig. 1 shows an example of what happens as the distance between the centerline of belt pull and the adjacent bearing is extended.

Overhung Sheave

$$\text{Load at B, lbs.} = \frac{\text{Belt Pull} \times (a + b)}{a}$$

Fig. 1

| a     | b    | Belt Pull | Bearing Load "B" |
|-------|------|-----------|------------------|
| 10 in | 1 in | 500 lbs   | 550 lbs          |
| 10 in | 5 in | 500 lbs   | 750 lbs          |

Now consider the same situation for a motor or gearbox. Referring to Fig. 2, it should be obvious that the sprocket should be mounted as close as possible to the face of the gearbox.

As the distance between the gearbox face and sprocket increases, the bearing load is also increased, which leads to a reduction in bearing life.

Fig. 2

Another warning from gearbox manufacturers is that the centerline of belt pull should not extend beyond the end of the shaft. Given a choice of a small diameter, wide face-width drive design, or a larger diameter, narrower face-width alternative, the latter would be preferable if bearing life is an important consideration.

### DRIVE DESIGN CONSIDERATIONS

For any given application, there are usually several possible drive alternatives. In some cases, the selection with the smallest diameter sprockets might be the least expensive. As can be seen from the previous discussion, this alternative could be a bad choice. Smaller diameter sprockets lead to higher belt pull; their greater width is also more sensitive to misalignment.

## HT500 Drive Installation

### Sprocket Installation

1. Thoroughly inspect the bore of the sprocket and the tapered surface of the bushing. Any paint, dirt, oil or grease must be removed.
2. Assemble bushing into sprocket. Loosely insert the screws into assembly. At least one sprocket must have flanges.
3. With key in keyseat of shaft, slide sprocket to its desired position with screw heads to the outside. If it is hard to slide the bushing onto the shaft, check shaft for burrs, etc.
4. Line up assembly so as not to misalign belts and tighten screws evenly and progressively. Apply the recommended torque to screws.

### Sprocket Alignment

HT500 sprocket alignment and parallelism of the shafts is very important. Proper alignment helps to equalize the load across the entire belt width, thereby reducing wear and extending belt life.

Place a straightedge against the outside edge of the sprockets and move sprockets until the straightedge touches the two outside and two inside edges of the sprockets. The straightedge should cross the sprockets as close to the shafts as possible. A string can be used if a straightedge is not available. Remember the string should contact at four points as explained above. Note that the precision laser alignment tool (pn **109993**) is an accurate and practical alternative to the straightedge method.

After aligning the sprockets, check the rigidity of the supporting framework. Shafts should be well supported to prevent distortion and a resulting change in the center distance under load. Do not use spring-loaded or weighted idlers. Idler sprockets or pulleys must be locked into position after adjusting belt tension.

## Belt Installation and Tensioning

Do not pry or otherwise force the belt onto the sprockets, as this can result in permanent damage to the belt. Reduce the center distance between the pulleys so that the belt can be easily installed.

HT500 drives must be properly tensioned. If the belt is too loose, it may jump teeth when heavier loads are applied. If the belt is too tight, belt life will suffer, and bearings will be unnecessarily overloaded. Improper tension can result in excessive drive noise.

### Force/Deflection Tensioning Procedure:

First, measure the span length and calculate the deflection distance of 1/64, per inch span (see illustration).

Apply the calculated deflection force at the center of the span. Measure the deflection with this force applied. Move the center distance until the proper deflection is obtained.

### Sonic Tension Meter Method:

The Sonic Tension Meter (pn **109994**) measures frequency in the belt upon an applied stimulus. The meter will then provide an output of both frequency and calculated static tension. The

static tension is calculated based upon three user inputs: belt width, span (as measured in the above illustration) and the belt's mass constant. Variables for belt mass constants are provided in the following table.

| Belt  |     | Adjusted Belt Weight (g/m) |
|-------|-----|----------------------------|
| HT200 | 5M  | 4.1                        |
| HT200 | 8M  | 5.5                        |
| HT200 | 14M | 9.6                        |
| HT250 | 8M  | 5.8                        |
| HT250 | 14M | 9.7                        |
| HTD   | 8M  | 6.2                        |
| HTD   | 14M | 9.9                        |
| HTD   | 20M | 12.8                       |
| HT500 | 14M | 7.9                        |
| HT500 | 8M  | 4.7                        |

To measure the belt's span vibration:

Input parameters of span length, belt width and the belt mass constant into the meter.

Press the MEASURE button on the meter.

Thumb the belt at center span as if strumming a guitar string.

Hold the microphone 1/4" away from the back of the belt.

The tension meter will display static tension and frequency. Compare the frequency output to the formula below. Note that drive outputs of static tension and frequency are also provided on-line from the ViaSync selection program at [www.ptwizard.com](http://www.ptwizard.com).

$$T = 4 * M * W * S^2 * f^2 * 10^{-9}$$

- Where:
- T = Belt span tension (Newtons)
  - M = Belt mass constant (g/m)
  - W = Belt width (mm)
  - S = Span length (mm)
  - f = Natural frequency of the belt at applied tension (Hz)

## Drive Alignment

Good tracking of synchronous belts on their sprockets depends upon alignment to within ¼°. This translates to a maximum “M” dimension of 0.05” per foot center distance.

## Drive Tensioning

### Formula Method

The formula method for determining belt tension may be used for greater accuracy.

**Step 1.** Calculate Min. Installation Tension:

Formula 1:

$$T = \frac{20 \text{ (HP)}}{V} + mV^2$$

Where: HP = Horsepower  
 V = Belt Velocity/1000 (in FPM)  
 m = Value in Table 1.  
 Belt Velocity = PD x RPM x 0.262  
 (PD = Pitch Dia. in inches)

Note: For used belt, use 0.7\*T to 0.8\*T instead of the 1.0\*T and 1.1\*T for new belts.

T = Static tension, lbs  
 L = Belt length, inches  
 Y = Factor from Table 2.  
 K = Span length, inches  
 CD = Center distance, inches  
 D = Large pulley diameter, inches  
 d = Small pulley diameter, inches

$$k = \sqrt{CD^2 - \frac{(D-d)^2}{4}}$$

**\*Important!** If formula calculation for “T” is less than “Min T. Value” (Table 2) use the “Min T. Value” for T. Always use the greater T value; i.e. from T Formula 1 or Table 2.

**Step 2.** Calculate Deflection Forces:

Formula 2:

$$MinForce = \frac{1.0 * T + \left(\frac{K}{L}\right) Y}{16}$$

Formula 3:

$$MaxForce = \frac{1.1 * T + \left(\frac{K}{L}\right) Y}{16}$$

## Drive Tensioning

Table 1

|       | Pitch | Width  | m     | Y      | Min Ts |
|-------|-------|--------|-------|--------|--------|
| HT200 | 5 mm  | 15 mm  | 0.28  | 24.9   | 14     |
| HT200 | 5 mm  | 25 mm  | 0.47  | 41.5   | 23     |
| HT200 | 8 mm  | 20 mm  | 0.58  | 34.2   | 19     |
| HT200 | 8 mm  | 30 mm  | 0.88  | 51.3   | 30     |
| HT200 | 8 mm  | 50 mm  | 1.46  | 85.5   | 52     |
| HT200 | 8 mm  | 85 mm  | 2.45  | 145.3  | 95     |
| HT200 | 14 mm | 40 mm  | 1.78  | 93.0   | 77     |
| HT200 | 14 mm | 55 mm  | 2.44  | 127.9  | 120    |
| HT200 | 14 mm | 85 mm  | 3.77  | 197.7  | 206    |
| HT200 | 14 mm | 115 mm | 5.11  | 267.5  | 291    |
| HT200 | 14 mm | 170 mm | 7.55  | 395.4  | 447    |
| HTD   | 20 mm | 115 mm | 7.24  | 367.0  | 392    |

HT500 Synchronous Drives

Roller Chain Sprockets

## Software: Via - SYNC

For any given synchronous drive application, there may be several DODGE HT500, HT200, HTD or DODGE DYNA-SYNC® product combinations that could satisfy the requirements. Finding the best drive can be a time-consuming and frustrating task.

The DODGE VIA-SYNC program provides selections for all of these product offerings for both TAPER-LOCK® and QD\* type sprockets. All relevant data for limited and unlimited drive selections is presented in a format that allows quick and accurate analysis and sorting, whether based upon lowest price, minimum bearing load, highest service factor, etc.

VIA-SYNC calculates speed up drives or drives for nonstandard motor speeds. The most appropriate selection can then be specified, which contains sprocket, bushing and belt sizes and part numbers.

VIA-SYNC has the capability of sharing data with DODGE T-A DISCOVERY™ or DODGE SCD DISCOVERY™ programs.

Dodge VIA-SYNC can be accessed from [www.ptwizard.com](http://www.ptwizard.com). Additional troubleshooting and selection assistance is available at 864-284-5700.

## Troubleshooting

| Problem                      | Cause                           | Remedy   |
|------------------------------|---------------------------------|--|
| <b>Unusual Noise</b>         | Misaligned drive                | Re-adjust alignment                            |
|                              | Hi or Low belt tension          | Adjust to recommended value                    |
|                              | Backside idler                  | Use inside idler                               |
|                              | Worn sprocket                   | Replace sprocket                               |
|                              | Bent sprocket flange            | Replace or repair                              |
|                              | Excessive belt speed            | Redesign drive                                 |
|                              | Incorrect belt profile          | Replace with DODGE belt                        |
|                              | Subminimal spkt. dia.           | Redesign with lager spkts.                     |
|                              | Excessive load                  | Use higher capacity drive                      |
|                              | Weak mntg. structure            |  |
| <b>Loss of Belt Tension</b>  | Weak mntg. structure            | Reinforce mounting structure                   |
|                              | Excessive spkt. wear            | Use wear-resistant sprockets                   |
|                              | Fixed center drive              | Install inside idler                           |
|                              | Excessive debris                | Install adequate drive guard.                  |
|                              | Excessive load                  | Use higher capacity drive                      |
|                              | Subminimal spkt. dia.           | Redesign drive                                 |
|                              | Drive running hot               | Use heat fingers on hot shaft                  |
| Belt degradation             | Protect from excessive heat     |  |
| <b>Belt Edge Wear</b>        | Damaged flanges                 | Repair or replace sprocket                     |
|                              | Low belt tension                | Adjust to recommended value                    |
|                              | Poor tracking                   | Correct alignment                              |
|                              | Guard interference              | Remove obstruction, add idler                  |
| <b>Pre-mature Tooth Wear</b> | Improper tension                | Correct drive tension                          |
|                              | Poor alignment                  | Correct drive alignment                        |
|                              | Wrong belt type                 | Use correct DODGE belt                         |
|                              | Worn sprocket                   | Replace  |
|                              | Damaged sprocket                | Replace  |
|                              | Excessive load                  | Use higher capacity drive                      |
|                              | Dirt or debris                  | Install adequate drive guard                   |
| Sprocket wobble              | Correct bushing installation    |  |
| <b>Tooth Shear</b>           | Shock loads                     | Use higher capacity drive                      |
|                              | Few teeth in mesh               | Redesign drive                                 |
|                              | Worn sprocket                   | Replace  |
|                              | Backside idler                  | Use inside idler                               |
|                              | Wrong belt profile              | Use correct DODGE belt                         |
| Low belt tension             | Adjust to recommended value     |  |
| <b>Tensile Break</b>         | Shock load                      | Use higher capacity drive                      |
|                              | Subminimal spkt. dia.           | Redesign with larger spkts.                    |
|                              | Debris in drive                 | Install adequate drive guard                   |
|                              | Improper belt handling, storage | Do not crimp belt or subject it to sharp bends |

| Problem                  | Cause                                | Remedy                        |
|--------------------------|--------------------------------------|-------------------------------|
| <b>Belt Cracking</b>     | Subminimal spkt. dia.                | Redesign with larger spkts.   |
|                          | Backside idler                       | Install inside idler          |
|                          | Start-up temp below 180 degrees F    | Preheat drive before start-up |
|                          | Extended exposure to harsh chemicals | Protect drive                 |
| <b>Bearing Failure</b>   | Excessive belt tension               | Adjust to recommended value   |
|                          | Drive misalignment                   | Re-adjust alignment           |
|                          | Subminimal spkt. dia.                | Redesign with larger spkts.   |
| <b>Vibration</b>         | Wrong belt profile                   | Install correct DODGE belt    |
|                          | Hi or Low belt tension               | Adjust to recommended value   |
|                          | Loose key or bushing                 | Install per instructions      |
| <b>Belt not Tracking</b> | Loose mounting structure             | Reinforce or tighten          |
|                          | Misalignment                         | Re-adjust alignment           |
|                          | Long center distance                 | Carefully adjust alignment    |
|                          | Mtg. structure bending               | Reinforce mounting structure  |

Roller Chain Sprockets

# FEATURES/BENEFITS

## Sprockets for Roller Chain

FEATURING TAPER-LOCK SPROCKETS . . . . .

### Shaft Ready

For low-speed roller chain drives, DODGE TAPER-LOCK sprockets are the perfect solution for extra muscle.

### Advantages

- Features Compact design
- Installs easily
- Fits shaft securely
- Comes in wide range of stock sizes
- Allows exact ratio/rating required for your operation
- Installation-ready, right from the box
- Meets ANSI standards
- B-reborable and A-plate sprockets available  
Contact Dodge at [www.dodge-pt.com](http://www.dodge-pt.com)

### Hardened Teeth at No Extra Cost

- Through 25 teeth
- #40 through #160
- No price premium

### Advantages

- Offers twice the wear life
- Saves downtime and replacement costs
- Equalizes wear between large and small sprocket
- Offers greater resistance against abrasive wear
- Extends chain life

DoubleStrand  
TAPER-LOCK Sprocket

Single  
TAPER-LOCK Sprocket

Double-Single  
TAPER-LOCK Sprocket

### HARDENED TOOTH SPROCKETS LIKE THIS

With Hardened Tooth Sprockets

### Other Sprocket Types From Dodge

B-Reborable  
Sprockets

A-Plate  
Sprockets

### AVOID SPROCKET WEAR LIKE THIS

Without Hardened Tooth Sprockets

## Simple Mounting

### Easy On

- Insert busing into sprocket.
- Match holes (not threads)
- Put screws into holes that are farthest apart.
- Slip unit onto shaft.
- Set drive alignment and tighten screws

### Easy On

- Take both screws out entirely.
- Insert one screw into hole that is threaded in the bushing only.
- Use as jackscrew to disengage bushing.

# SPECIFICATION

## No. 35 for 3/8" Pitch Single Strand Chain

TYPE BTL

### TAPER-LOCK Sprockets

## SELECTION

### Roller Chain Drive Selection

#### EASY SELECTION METHOD

**1. Determine Class of Service:** Refer to tabulation below, or select from the following:

**Class A:** Fairly uniform running load. Start-up and peak loads occur infrequently.

**Class B:** Variable running load. Higher starting and peak loads, occurring more frequently.

**Class C:** Heavy starting loads. Peak loads and overloads occurring frequently.

**2. Select Service Factor:**

| Class of Service | Type of Input Power                             |                     |  |
|------------------|---|---------------------|--|
|                  | Internal Combustion Engine with Hydraulic Drive | Electric or Turbine | Internal Combustion Engine with Mechanical Drive |
| A                | 1.0   | 1.0                 | 1.2  |
| B                | 1.2   | 1.3                 | 1.4  |
| C                | 1.4   | 1.5                 | 1.7  |

**3. Calculate Design Horsepower:** Motor HP x Service Factor, or normal running HP x Service Factor.

**4. Determine Chain Size and Smaller (Usually the Driver) sprocket number of teeth:** Refer to "Recommended Small Sprocket" table on page PT13-18 and PT13-19. Start at column that is at or above the calculated design HP. Trace down to the row that includes the RPM of the faster (Usually the Driver) shaft. The chain pitch and sprocket No. of Teeth are listed at this intersection.

**5. Calculate Drive Ratio:** Faster shaft Rpm divided by Slower shaft RPM.

**6. Determine Size of Large Sprocket:** Multiply smaller sprocket No. of teeth by ratio. Select Closest stock available sprocket.

**7. Calculate Chain Length "L":**

$$L = 2c + 1.57(D + d) + \frac{(D-d)^2}{4c}$$

Where: D = Pitch dia. large sprocket, (see page PT13-31)

d = Pitch dia. small sprocket, (see page PT13-31)

c = Proposed center distance

(Accuracy is within .15% chain length)

Divide chain length (inches) by chain pitch to determine number of pitches in the chain. Good practice is to use an even number of pitches, including connecting link.

| Class of Service for Driven Machine                         |       |   |       |
|---|-------|---|-------|
| Driven Machine  | Class | Driven Machine                                      | Class |
| Agitators, liquid or semi-liquid stock, paddle or propeller | A     | Line Shafts:  |       |

|   |       | Woodworking Machinery                               | B     |

## SELECTION EXAMPLE

A chain drive is required for a tumbling barrel for metal stampings. The barrel is to run at 24 RPM from a speed reducer output of 77 RPM. Center distance is 50". Input power is from a 5 HP electric motor. Starting loads are heavy, peak loads and overloads are frequent.

**1. Service Factor:** Class of service is not listed in table, so refer to Class Description. Class C is appropriate. Service Factor Table shows 1.5 Class C driven by an electric motor.

**2. Design HP:** Motor HP x S.F. 5 x 1.5 = 7.5 Design HP.

**3. Chain and Small Sprocket Size:** Refer to the 7-1/2 HP column of the Easy Selection Table. Trace down to the row that includes 77 RPM, "71-80 RPM". No. 100 chain and sprocket with 15 teeth is shown: select 100BTL15.

**4. Drive Ratio:** 77/24 = 3.21:1.

**5. Large Sprocket:** 15 x 3.21 = 48.15. Select a 48 tooth driven sprocket, 100BTL48, which is a stock size.

**6. Chain Length:**

$$L = 2(50) + 1.57(19.113 + 6.013) + \frac{(19.113 - 6.012)^2}{4 \times 50}$$

L = 140.31" (No.100 Chain has 1-1/4 or 1.25" Pitch)

Length in pitches = 140.31/1.25 = 112.48 pitches.

Choose 112 or 114 Pitches of chain, including Conn Link.

7. Verify that sprockets will fit shaft sizes.

## DESIGN NOTES

**Small Sprocket Size:** The higher RPM and the fewer the number of teeth on the small sprocket, the greater the wear.

This leads to some general guidelines:

- Use at least 17 teeth sprocket for 100+ RPM.
- Avoid high ratios that require very small sprockets

**Lubrication:** Chain drives must be lubricated and kept clean. The most effective method to accomplish this is to use an oil-tight chain guard with an oil sump. Manual lubrication is effective on slower speed drives, but exposure to dirt and contamination will be a problem for the drive.

**Design Refinement:** The "Easy Selection Method" is a good starting point for further design refinement, if desired. Refer to the Chain HP Rating Tables on the following pages for more precise ratings. Also refer to "Slow Speed Drives" which follows this section.

## SLOW SPEED DRIVES

Where linear speed of the chain is under 100 fpm and loading is uniform, roller chain drives may be selected on the basis of chain pull rather than horsepower rating. This often results in significant savings.

When chain length is more than 50 pitches, the maximum applied load may be as great as 1/7 of the ultimate tensile strength of the chain for speeds below 50 fpm to 100 fpm.

Unusual load variations of peak loads require other methods of determining the maximum applied load.

Chain pull may be calculated by the following formula:

$$\text{Chain Pull (lbs.)} = \frac{\text{Design HP} \times 126,000}{\text{rpm} \times \text{Pitch diam.}}$$

Table below offers a simplified method of determining allowable chain pull for slow speed drives. The table also shows revolutions per minute for a given pitch diameter at 50 and 100 feet per minute. Average tensile strength for all popular roller chains is given on page PT13-32.

### Information for Slow Speed Drives

| Chain No. | Allowable Chain Pull for STD. Chain |              | RPM for a Given Pitch Diam. at Various Speeds |              |               |
|-----------|-------------------------------------|--------------|---|--------------|---------------|
|           | Max. Chain Pull                     |              | P.D. in inches                                | @ 50 fpm RPM | @ 100 fpm RPM |
|           | @ 50 fpm or less                    | @ 50-100 fpm |   |              |               |

| 200       | 13,571                              | 11,875       | 11  | 17.3         | 34.7          |
| 240       | 18,571                              | 16,250       | 12  | 15.9         | 31.8          |

Note: Smaller sprockets can be used on slow speed drives as the effects of chordal action are not pronounced. However, small sprockets of fewer than 9 teeth should be avoided.

## MULTIPLE STRAND CHAIN DRIVES

Single Strand drives offer cost and availability advantages, and are more easily assembled. Multiple strand drives can be used to solve design problems of greater HP capacity or space constraints. For multiple strand drives, divide the calculated Design HP by the factors below, and select from the ratings for single strand drives:

| Multiple Strand Factors |     |
|-------------------------|-----|
| Single:                 | 1.0 |
| Double                  | 1.9 |
| Triple:                 | 2.8 |

# SELECTION

## Easy Selection Table RECOMMENDED SMALL SPROCKET

| RPM of small Sprocket | Chain Size and No. of Teeth for Design HP |       |        |        |        |        |        |        |        |        |        |        |
|-----------------------|---|-------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|                       | 1/4                                       | 1/3   | 1/2    | 3/4    | 1      | 1 -1/2 | 2      | 3      | 4      | 5      | 6      | 7 -1/2 |
| 951-1000              | 35 17                                     | 35 17 | 35 17  | 35 17  | 35 17  | 35 17  | 35 17  | 35 23  | 40 17  | 40 17  | 40 20  | 40 24  |
| 901-950               | 35 17                                     | 35 17 | 35 17  | 35 17  | 35 17  | 35 17  | 35 17  | 35 24  | 40 17  | 40 18  | 40 21  | 40 25  |

**Notes:**

- Apply Service Factor to obtain Design Horsepower. Select small sprocket based upon Design Horsepower and RPM on this chart.
- Sprocket selections are recommended minimum. Larger sizes may be selected if required to obtain desired ratio, etc.
- To use this chart for double or triple strand chain, divide the design horsepower by the following factors:  
Double strand: 1.9, Triple strand: 2.9

4. Sprocket selections above the bold line are based upon ANSI horsepower ratings. Selections below the bold line are based upon the chain pull formula for slow speed drives.

5. To achieve design life keep chain free of dirt and contaminants, and apply appropriate lubrication.

**Lubrication Note**

- TYPE A: Manual or Drip
- TYPE B: Bath or Disc
- TYPE C: Oil Stream

**Multiple Strand Chain HP Factors:**

|               |     |
|---------------|-----|
| Single Strand | 1.0 |
| Double Strand | 1.9 |
| Triple Strand | 2.8 |

**Shaded Area: Operation is in the galling range - consult factory**

**Explanation of Lubrication:**

**TYPE I:** Steady Drip (4-10 drops/minute) shallow bath or manual w/oil applied by brush or spout can to link plate edges when in lower span of chain.

**TYPE II:** Rapid Drip (20 drops/minute, min.) or continuous w/ shallow bath, disc or slinger.

**TYPE III:** Continuous w/disc, slinger or circulating pump.

**Additional Information**—ANSI Roller Chain Standard B29.3, Section A1.3.

## RELATED PRODUCTS

### Tensioner Frame, Idler Sprockets

Proper chain tension is necessary for normal life expectancy. It's also a prime consideration for the efficient, quiet operation of the drive.

The tensioner frame shown below provides an economical means of locating an idler sprocket on a 1/2, diameter machine bolt or a 5/8, diameter spacer. Frame can be mounted in several positions on surfaces either parallel or perpendicular to the chain, suitable for either conventional or cantilever mounting.

#### Chain Tensioner Frame, P/N 102050

This formed steel frame has mounting holes in the bottom and one side so it can be mounted in several positions on surfaces parallel or perpendicular to the chain. Included is a 5/8" O.D. sleeve and a 1/2" diameter machine bolt to use with 1/2" and 5/8" bore idler sprockets.

Spacer washers may be used to obtain the chain clearance required. Idler sprocket table below shows minimum space required for chain clearance.

Part Number **102050**

Weight .73 lbs

#### Idler Sprockets

Although these idler sprockets are designed to be used with the frames shown above, they can be mounted on standard machine bolts as shown in table below. Idler sprockets will operate at the same speeds permitted for driver sprockets of the same number of teeth. They are machined all over with teeth hardened to assure smooth-running drives. They are available with either bronze sleeve or ball bearings in the sprocket bore. The sleeve bearing runs on a hardened and ground steel journal. The ball bearings are double-sealed and prelubricated.

## Chain Tools

**Chain Assembly Tools**

This unique tool was designed to make sizes 35 thru 240 chain installation easy. By hooking the two jaws into each end of the chain and turning the screw (handle) until the two ends almost meet, the connecting link can be inserted and fastened in place. The photo shows the Model 35 tool. The Model 80 uses a T-handle instead of a knob.

| For Chain Nos. | Jaw Spread of Tool | Part No. | Wt. (Lbs.) |
|----------------|--------------------|----------|------------|
| 35 thru 60     | 2"                 | 098190   | .4         |
| 80 thru 240    | 5"                 | 098191   | 2.2        |

**Chain Pin Extractors (Chain Breaker)**

This fast working tool is practical for removing chain pins when roller chain needs to be disconnected or when various lengths of chain need to be made up.

Three sizes of pin extractors are available to use on riveted and cottered chain, sizes 25 thru 160. This tool, if properly used, will not damage chain, and pins can be reused.

## ENGINEERING/TECHNICAL

### Custom TAPER-LOCK Sprockets

Non-stock or special TAPER-LOCK sprockets may be fabricated from stock TAPER-LOCK hubs and A-Plate sprockets rebored to fit the hubs. This provides the capability for fabricating sprockets with larger bore capacity, or number of teeth that are stocked as A-Plate but not TAPER-LOCK. This operation can be done on location, or supplied by DODGE, price on application. DODGE TAPER-LOCK hubs are available in three types: S, K and W/WA. All are of quality steel bar stock or forgings, easily welded, and ready to accept TAPER-LOCK Bushings. For more detailed information and dimensions, refer to Bushings/Hubs section of this catalog.

\* Represents Type B or C hub type sprocket.

† Represents an "A" plate sprocket or a welded sprocket using an "A" plate.

## Installation, Maintenance

### Installation of Roller Chain Drives

**Shaft Alignment** – Shafts must be parallel. The use of a spirit level is recommended to make sure shafts are horizontal; then, if the distance between the shafts are equal on both sides of the drive, the shafts are parallel. Shafts, bearings and supporting structure should be suitable to maintain this alignment.

**Sprocket Location** – Locate each sprocket as close as possible to a bearing.

**Sprocket Alignment** – Sprockets must be aligned accurately. This can best be accomplished by checking with a straight edge along the finished sides of the sprockets as shown in the drawing.

**Chain Tension** – Chains should be installed fairly tight with only a small amount of slack. In the case of vertical drives the chain should be kept snug. New chains will loosen up slightly as the joints seat themselves, causing initial elongation which is many times greater than the elongation during the balance of the chain life. After the first several weeks of operation it is advisable to adjust the centers, particularly on long center drives. After this initial elongation, with proper care and lubrication, roller chains will give long service without undue elongation or wear.

**Center Distance** – It is desirable to provide some means of adjusting the center distance between sprockets.

This is particularly true with drives of long center distance. When the centers are fixed it is advisable to use an idler sprocket to provide the proper chain tension originally, and also to compensate for natural chain wear.

**Hardened Teeth** – The advantages gained by hardening the teeth of the small sprocket easily offset the hardening cost. Longer life, increased strength, equalized wear between small and large sprockets—all result in lower overall cost to the chain drive user. Hardened steel sprockets are recommended for use under the following conditions: 1. Slow speed, heavily loaded drives where chains and sprockets are selected on the basis of chain tensile strengths; 2. Moderate speed drives where sprockets have 17 teeth or less; 3. High speed drives where sprockets have 25 teeth or less; 4. When speed ratios exceed 4 to 1; 5. When drives are operating exposed to dirty or dusty surroundings.

### Lubrication of Roller Chain Drives

Lubrication of roller chains is essential for effectively minimizing metal-to-metal bearing contact of pin-bushing joints of the chain. Oil should be applied to outside plate and inside plate edges, since access to pin-bushing areas is possible only through clearances between the outside plates and the inside plates. Oil applied on the center line of rollers cannot reach pin-bushing joints.

Chain drives should be protected against dirt and moisture and the oil supply kept free of contamination. Periodic oil change is desirable. A good grade of non-detergent petroleum base oil is recommended. Heavy oils and greases are generally too stiff to enter and fill the chain joints. The following table indicates the proper lubricant viscosity for various surrounding temperatures. For higher temperatures—consult factory.

| Temperature Degrees F. | Recommended Lubricant |
|------------------------|-----------------------|
| 20 to 40               | SAE 20                |
| 40 to 100              | SAE 30                |
| 100 to 120             | SAE 40                |
| 120 to 140             | SAE 50                |

The method of lubrication, which is governed by the speed of the chain and the amount of power transmitted, is indicated in the HP Rating Tables. Note that these are minimum lubrication requirements and the use of a better type (for example, Type 4 instead of Type 3) is acceptable and may be beneficial. The four basic types of lubrication indicated are described below.

**Type A—Manual Lubrication** – Oil is applied periodically with a brush or spout can, preferably once every 8 hours of operation. Volume and frequency should be sufficient to prevent discoloration of lubricant in the chain joints.

**Type A – Drip Lubrication** – Oil drops are directed between the link plate edges from a drip lubricator. Volume and frequency should be sufficient to prevent discoloration of lubricant in the chain joints. Precaution must be taken against misdirection of the drops by windage.

**Type B – Bath or Disc Lubrication** – With bath lubrication the lower strand of chain runs through a sump of oil in the drive housing. The oil level should reach the pitch line of the chain at its lowest point while operating. With disc lubrication, the chain operates above the oil level. The disc picks up oil from the sump and deposits it onto the chain, usually by means of a trough. The diameter of the disc should be such as to produce rim speeds between 600 fpm minimum and 8000 fpm maximum.

**Type C – Oil Stream Lubrication** – The lubricant is usually supplied by a circulating pump capable of supplying each chain drive with a continuous stream of oil. The oil should be applied inside the chain loop evenly across the chain width, and directed at the lower strand.

|                                  |                               |                           |                                  |

## FEATURES/BENEFITS

Today, the industrial marketplace demands quality products and services. Dodge has the experience and expertise to meet those demands from engineering support to on-time delivery. Dodge offers the broadest range of conveyor pulleys with a combination of the best resources for pulley manufacturing. The Dodge Conveyor Components Team is ready to provide you the best customer service in the industry.

**Lagged Drum Pulley**

**T-Section Pulley**

**Mine Duty Extra Drum Pulley**

**Wing Pulley**

## Conveyor Pulley Locking Devices

### HE Bushing/Hub

- Most dependable mounting system for conveyor pulleys
- Specifically designed for drum and wing pulleys
- Flange mount design
- Easy installation/removal
- Shaft diameters up to 12"
- Taper angle of 14° reduces axial movement along the shaft to tighten the bushing
- Disc deflection and pre-stressing are greatly reduced
- Full length hub engagement

### Keyless Locking Devices

- High torque capability
- No axial movement during assembly
- Shrink fit design assures a tight mechanical fit
- Easy installation/removal
- No keyway stress - no keys required
- Recommended for shafts over 12" and up to 30" in diameter

### Taper-Lock Bushings

- Industry standard for over 40 years
- Easy-on, Easy-off
- 8° taper grips tight, holds tight, runs true, no wobble
- World-wide acceptance and availability
- Flush mounting - no protruding parts

### QD Bushings

- Flanged design
- 4° taper
- Easy-on, Easy-off
- Manufactured precisely to industry standards
- Reverse mounting

### XT Bushings/Hub

- Designed for conveyor pulley applications
- 9-1/2° taper
- 2" per foot taper for easy on, easy off
- Full length hub engagement

# SPECIFICATIONS

## Belt Conveyor Pulleys

Dodge offers two standard designs that are stocked for quick delivery, CEMA duty (Conveyor Equipment Manufacturers Association), HE (High Endurance) welded hub and Mine Duty Extra HE integral hub construction. These are available with a plain surface and rubber lagged. HE bushings with 14 degree taper and 3/8 inch 60 Durometer SBR rubber, with herringbone groove lagging, are standard, stocked features.

Dodge recommends pulley designs within the four classes of service detailed below. All of our designs strive for balance between cost and reliability. When possible, welds are avoided or eliminated to maintain the full strength of the base metal. Our welded designs rely upon the chemistry of the base metal, the type of weld and the geometry of the structure to achieve optimum post-weld performance as explained below.

### WARRANTY

- Class IV and III pulleys are conditionally warranted against defects in material and workmanship for one year of operation. A two-year warranty is available when loading information is provided.

Note: Special Construction features listed at the bottom of page PT14-6 can be added to both Class IV and III pulleys to extend service life. Because these pulleys are made-to-order, they will require longer leadtime for shipment. The Special Construction modifications must be quoted at the time of inquiry and before order entry.

- Class II and I pulleys are conditionally warranted against defects in material and workmanship for two years of operation, because loading information must be provided.

### CLASS IV

Dodge Heavy Duty CEMA Standard drum pulleys use 14 degree taper welded hubs and bushings with special consideration for post weld strength with submerged arc welds. These pulleys meet or exceed all requirements for steel drum pulleys established by CEMA, and as detailed in

ANSI standard number B105.1. The standard establishes load ratings and dimensions for use with fabric belts rated to 800 PIW (Pounds per Inch of belt Width).

### CLASS III

Dodge Mine Duty Extra pulleys use a proprietary 14 degree (taper) one piece integral hub to accept HE bushings. This eliminates the two welds of the hub into the end disc and delivers 100% of the capacity of the end disc steel. There is not a universal standard published for this class of service. The Dodge MDX design gives much higher safety factors than pulleys designed to meet the CEMA load ratings, while fitting into the CEMA dimensions.

### CLASS II

Dodge Engineered pulleys utilize one-piece integral hub-and-end-discs and either HE 14 degree taper compression bushings or keyless locking devices. They are designed specifically to meet customer supplied load and tension ratings. This class is for fabric or steel cable conveyor belts rated to 2,499 PIW. These pulleys incorporate machined rims and lagging, static balance, stress relieving, magnetic particle and/or ultrasonic weld testing.

### CLASS I

Dodge Engineered pulleys with one piece "T" section machined end discs are continuously butt welded to the pulley rim for fabric or steel cable belts rated over 2,500 PIW up to the maximum available from belt manufacturers, currently in excess of 10,000 PIW. These pulleys use keyless locking devices for shafts up to 30" in diameter. These pulleys incorporate machined rims and lagging, static balance, stress relieving, magnetic particle and/or ultrasonic weld testing. All Class I pulleys are manufactured within a 60 step documented Quality Assurance Process.

**Important Note: To Ensure You Get The Right Class Of Pulley For Your Application, Please Fill Out And Send the Engineered Pulley Data Sheet, Shown On Page PT14-9.**

## Belt Conveyor Design Program - Available on [www.ptwizard.com](http://www.ptwizard.com)

The Dodge Computerized Conveyor Design Program selects Baldor/Dodge drive products for simple horizontal or uphill conveyors up to 3500 feet long, 800 feet lift, and 3500 tons per hour. The program operates with a minimum of input information and provides detailed design and product information as output. Input variables and output data are:

### INPUT

- Conveyor Capacity (tons per hour)
- Length of Conveyor
- Lift of Conveyor
- Basic Conveyor Profile (7 profiles)
- Material to be Moved
- Belt Speed (not required, can be selected by program)
- Belt Width (not required, can be selected by program)
- Idler Angle (not required, can be selected by program)

### OUTPUT

- Motor Horsepower
- Belt Width (if not input)
- Idler Angle (if not input)
- Belt Speed (if not input)
- Drive Pulley RPM
- Belt Tensions (& take-up weight)
- Pulley Diameters, Face Width & Shaft Diameter
- Bearing Centers
- Lagging
- Shaft Lengths
- Bearing Diameter with L10 Life
- Maximum Running Belt Tension (PIW)
- Backstop Requirement
- Dodge Torque-Arm Reducers Selected

Baldor/Dodge has a conveyor design program, available at [www.ptwizard.com](http://www.ptwizard.com), for selecting CEMA drum pulleys for conveyor profiles shown. For other types of pulleys, please contact Baldor/Dodge Conveyors. For more information call 864-297-4800.

## Conveyor Profiles

*Only the seven types of profiles shown are available for design program analysis.*

# HOW TO ORDER

## Standard, Stocked CEMA and Mine Duty Extra Pulleys

Dodge Conveyor Drum and Wing Pulleys are available from stock in either CEMA, Mine Duty Extra Drum or Mine Duty Extra Wing pulley designs. Many part numbers are already available for various sizes of drum and wing pulleys in either crown or straight face. We can provide pulleys bare faced, or with a number of different lagging patterns and thicknesses. You can use the Nomenclature page to help provide a complete pulley description, for which you can find part numbers in the catalog that have already been assigned, or that our Conveyor Team can quote for you.

If you know the belt width you are using, you can use the CEMA standards to get the face width needed for the pulley. CEMA standards for pulley face width are belt width + 2 inches for belt widths up to 42 inches and belt width + 3 inches for belt widths for 48 inches to 60 inches. Drum and wing pulley diameters are dependent upon belting and the shaft diameter required for the application.

The selection process recommended by Baldor•Dodge for Dodge conveyor pulleys is covered beginning on page PT14-10.

### PULLEY ASSEMBLIES

One of the most popular services we offer is to package and assemble pulleys, shaft, bearings and coupling halves for shipment, ready to install on the customer's conveyor truss. However, to do this we must have accurate shaft dimensions and tolerances at the time of order entry. These determine the hub size of the pulley and the bearing size. Bearings are shipped to Clio from another Dodge plant. The pulley assembly process can be shortened by providing the shaft details outlined on page PT14-8. Please note – all pulley assemblies are considered non-standard because of the variability of size and weight.

## Special Construction Pulleys

There are Special Construction specifications that can be stipulated by the customer to extend the service life of CEMA and Mine Duty Extra pulleys, for demanding applications, or to meet special job requirements. If these modifications are required, the products will become made-to-order and identified by product description. These nonstandard modifications must be documented and quoted at the time of inquiry and before order entry.

These features include but are not limited to:

1. Rim and rubber lagging thickness
2. Rubber lagging material and durometer
3. Machining of rims and/or rubber lagging to a specified total indicated run-out (TIR)
4. End disc steel thickness
5. Shaft material surface finish (RMS) and turndown radii
6. Keyless locking devices with dust covers vs standard HE 14-degree compression bushings

7. Post weld thermal stress relieving before machining
8. Magnetic particle and/or ultra-sonic weld inspections
9. Static or dynamic balancing
10. Identification tags
11. Export or other special packaging

### ENGINEERED, MADE-TO-ORDER PULLEYS

All Dodge heavy duty CEMA or Mine Duty Extra pulleys are designed to meet or exceed the CEMA steel pulley ANSI standard B105.1. However, for pulleys engineered to the customer's application loads and tensions, we require completion of the Engineered Pulley Data Sheet, on page PT14-9.

Installation and Maintenance instructions for Dodge products are available at [www.dodge-pt.com](http://www.dodge-pt.com)

### Special Requirements:

# SELECTION

## Drum and Wing Pulleys - CEMA, MDX, Mine Duty

Proper selection of pulley diameter, face width and shaft diameter can easily be determined if the following information is known:

- Belt Width (BW)
- Bearing Centers (BC)
- Arc of Belt Contact ( $\alpha$ )
- Tight Side Belt Tension ( $T_1$ ) (for drive pulleys only)\*
- Slack Side Belt Tension ( $T_2$ )\*

### STEP 1

#### Determine Required Pulley Face Width

From:  $F = BW + 2''$  (for BW 42" and under)  
 $F = BW + 3''$  (for BW over 42")

Where: F = Pulley face width  
 BW = Belt width

**Note:** For replacement pulleys use face width of existing pulleys.

### STEP 2

#### Determine Bearing Center Minus Face Dimension

From:  $BCMF = BC - F$   
 Where: BCMF = Bearing center minus face dimension  
 F = Face width  
 BC = Bearing centerline to centerline dimension

**Note:** This selection guide is for conveyors with fabric belting. For other conveyor systems, consult factory for pulley selection.

**\*Note:** If belt tensions  $T_1$  and  $T_2$  are not known, please contact Dodge at (864) 297-8287.

### STEP 3

#### Determine Pulley Pounds Per Inch of Belt Width

From:  $PIW = T_1 \div BW$  (for drive pulleys)  
 $PIW = T_2 \div BW$  (for non-drive pulleys)\*

Where: PIW = Pounds per inch of width value  
 $T_1$  = Tight side tension  
 $T_2$  = Slack side tension\*  
 BW = Belt Width

**\*Note:** If non-drive pulley is on tight side of belt, substitute  $T_1$  for  $T_2$ . Wing pulleys should not be used as drive pulleys.

### STEP 4

#### Determine Minimum Pulley Diameter

**(Drum pulleys only)** Determine minimum pulley diameter using PIW, arc of belt contact ( $\alpha$ ) and Table 1. Reading across the table from proper arc of contact select pulley diameter with PIW rating greater than actual PIW. Final pulley diameter may be greater than the diameter selected from Table 1 and must be greater than the belt manufacturer's recommended minimum diameter.

**(Wing pulleys only)** Determine minimum pulley diameter using PIW and Table 2. Select pulley diameter with PIW rating greater than actual PIW. Final pulley diameter may be greater than the diameter selected from Table 2 and must be greater than the belt manufacturer's recommended minimum diameter.

|                                  |                              |                             |                                      |
|----------------------------------|------------------------------|-----------------------------|--------------------------------------|
| FEATURES/BENEFITS<br>PAGE PT15-2 | SPECIFICATION<br>PAGE PT15-4 | NOMENCLATURE<br>PAGE PT15-7 | SELECTION/DIMENSIONS<br>PAGE PT15-10 |

### STEP 5

#### Determine Pulley Resultant Load

Determine pulley resultant load from belt tensions and arc of contact.

Resultant load is calculated by:

$$R = 2 \times T_2 \times \sin(\alpha/2) \text{ (non-drive)*}$$

$$R = (T_1 + T_2) \times \sin(\alpha/2) \text{ (drive)*}$$

Where: R = Pulley resultant load

T<sub>1</sub> = Tight side tension

T<sub>2</sub> = Slack side tension

α = Arc of contact

\*Note: If non-drive pulley is on tight side of belt, substitute T<sub>1</sub> for T<sub>2</sub>. Wing pulleys should not be used as drive pulleys.

listed, interpolate or use the next higher value) until a load rating greater than the resultant load calculated in Step 5 is found. The proper shaft diameter is then read from the vertical shaft diameter column.

### STEP 6

#### Determine Shaft Diameter

Determine shaft diameter from Table 3. Go down the proper pulley face width column and across from the bearing center minus face value (if the correct value is not

**Table 2**

Use in STEP 4 to determine minimum pulley diameter for Wing Pulleys only MAXIMUM BELT TENSION (Pounds Per Inch of Belt Width)

| Dia. | Pounds Per Inch | Dia. | Pounds Per Inch |
|------|-----------------|------|-----------------|
| 8"   | 80#             | 18"  | 180#            |
| 10"  | 100#            | 20"  | 200#            |
| 12"  | 120#            | 24"  | 240#            |
| 14"  | 140#            | 30"  | 280#            |
| 16"  | 160#            | 36"  | 350#            |

# SELECTION

## Drum and Wing Pulleys

**Table 3 - Use In Step 6 To Determine Shaft Diameter Load Ratings (Pounds) For Pulley And Shaft Combinations**

| Shaft Diameter (Inches) | (L) Bearing Centers Minus Face | Pulley Face Width (Inches) |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|-------------------------|--------------------------------|----------------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|

# SELECTION

## Drum and Wing Pulleys

### STEP 7

#### Determine Drive Pulley Shaft Diameter

(For drive pulleys only) The shaft diameter determined in Step 6 must be checked for torque capacity. The shaft diameter required for torque is determined from:

$$D_T = 3 \sqrt{\frac{16}{\pi \times S} \times \sqrt{(K_B \times A \times R \div 2)^2 + [(T_1 - T_2) \times D \div 2]^2}}$$

- Where:  $D_T$  = Required shaft diameter from torque  
 $p = 3.1416$   
 $S = 8000$  psi for 1042 -1045 shafting  
 (10,000 for 4140)  
 $K_B = 1.5^*$   
 $A$  = Moment arm (from Table 4)  
 $R$  = Resultant load from Step 5  
 $T_1$  = Tight side tension  
 $T_2$  = Slack side tension  
 $D$  = Pulley Diameter

\*Note: Use  $K_B = 2.5$  for overhung load drive (chain, torque arm, etc.)  
 If  $D_T$  is greater than the shaft diameter from Step 6, round  $D_T$  up to the next standard shaft diameter and use that value. If  $D_T$  is less than the shaft diameter from Step 6, use the diameter selected from Step 6.

**Table 4 - A-Values**

| Shaft Dia. (inches) | A       | Shaft Dia. (inches) | A       |
|---------------------|---------|---------------------|---------|
| 1 to 2-7/16         | N+1-5/8 | 4-15/16             | N+3-1/4 |
| 2-11/16 to 2-15/16  | N+1-3/4 | 5-7/16 to 6         | N+4-1/2 |
| 3-7/16              | N+2-1/2 | 6-1/2 to 7          | N+5     |
| 3-15/16             | N+2-3/4 | 7-1/2 to 8          | N+5-1/4 |
| 4-7/16              | N+3     | 8-1/2 to 10         | N+6-1/4 |

N = BCMF ÷ 2

### STEP 8

#### Compare Pulley Diameter

Compare the pulley diameter, face width combination selected with the standard drum pulley listing on pages PT14-15 - PT14-33 or the standard wing pulley listing on pages PT14-34 - PT14-48 to insure the selected combination is available. If the selected combination is not available increase shaft diameter or pulley diameter until a standard pulley is listed.

#### Example 1 (Drive Pulley)

- Given: 36" belt width                      3600 lb.  $T_1$   
 52" bearing centers                      1600 lb.  $T_2$   
 210° arc of contact

#### Step 1

Determine required face width from:  
 $F = BW + 2"$                        $F = 36 + 2 = 38$

#### Step 2

Determine bearing center minus face dimension from:  
 $BCMF = BC - F$                        $BCMF = 52 - 38 = 14"$

#### Step 3

Determine pounds per inch of face width from:  
 $PIW = T_1 \div BW$                        $PIW = 3600 \div 36 = 100$  PIW

#### Step 4

Determine minimum pulley diameter using Table 1. Since  $PIW = 100$  and arc of contact is 210°, the minimum pulley diameter is 14".

#### Step 5

Determine resultant load from:  
 $R = (T_1 + T_2) \times \sin(\alpha/2)$   
 $R = (3600 + 1600) \times \sin(210/2) = 5023$  lb.

#### Step 6

**Determine shaft diameter using Table 3.** Using a face width of 38" bearing center minus face dimension of 14" and a pulley resultant load of 5023 lbs., read down the 38" face width column until the load rating at BCMF = 14" exceeds 5023 lb. The first value to exceed 5023 lbs. is 5800 lbs. at a shaft diameter of 3-7/16.

#### Step 7

Check torque capacity of selected shaft using:

$$D_T = 3 \sqrt{\frac{16}{\pi \times S} \times \sqrt{(K_B \times A \times R \div 2)^2 + [(T_1 - T_2) \times D \div 2]^2}}$$

$$D_T = 3 \sqrt{\frac{16}{3.1416 \times 8000} \times \sqrt{(1.5 \times 9.5 \times 5023 \div 2)^2 + [(3600 - 1600) \times D \div 2]^2}}$$

$D_T = 2.86"$

The 3-7/16 shaft diameter selected in Step 6 is greater than 2.86: therefore 3-7/16 is the final shaft diameter selection.

#### Step 8

Checking the standard pulley listing on page PT14-30, a 14 x 38 pulley with 3-7/16 shaft (HE35 Hub) is a standard pulley.

#### Example 2 (Non-drive wing pulley).

- Given: 54" belt width                      180° arc of contact  
 71 bearing centers                      8600 lb.  $T_2$

#### Step 1

Determine required face width from:  
 $F = BW + 3,$                        $F = 54 + 3 = 57,$

#### Step 2

Determine bearing center minus face dimension from: BCMF = BC - F  
 $BCMF = 71 - 57 = 14,$

#### Step 3

Determine pounds per inch of face width from:  
 $PIW = T_2 \div BW$                        $PIW = 8600 \div 54 = 159$  PIW

#### Step 4

Determine minimum pulley diameter using Table 2. Since  $PIW = 159$  the minimum pulley diameter is 16".

#### Step 5

Determine resultant load from:  
 $R = 2 \times T_2 \times \sin(\alpha/2)$   
 $R = 2 \times 8600 \times \sin(180/2) = 17,200$  lbs.

#### Step 6

Determine shaft diameter using Table 3. Using a face width of 57", bearing center minus face dimension of 14" and a pulley resultant load of 17,200 lbs., read down the 57" face width column until the load rating at BCMF = 14" exceeds 17,200 lbs. The first value to exceed 17,200 lbs. is 20,700 lbs. at a shaft diameter of 5-7/16.

#### Step 7

Checking the standard wing pulley listing on page PT14-46, a 16 x 57 wing pulley with 5-7/16 shaft (HE60 hub) is not a standard pulley. For a 5-7/16 shaft you must select a 24" diameter pulley.

|                                  |                              |                             |                                      |

# SELECTION/DIMENSIONS

## HE Heavy Duty Drum Pulleys

- Designed to CEMA specifications
- Standard crown face or straight face available
- 6" - 60" diameter and face widths exceeding 100", others available upon request
- HE bushing system designed specifically for Dodge Conveyor pulleys
- Most dependable mounting system for conveyor pulleys
- One piece die formed rim through 18"
- Rolled rim over 18"
- Available from stock

### HE Dimensions

| Hub   | A     | B    | Bushing | Max. Bore | Screw Torque (in.-lb.) |
|-------|-------|------|---------|-----------|------------------------|

# SELECTION/DIMENSIONS

## QD Heavy Duty Drum Pulleys

- Designed to CEMA specifications
- Standard crown face or straight face available
- 6" - 60" diameter and face widths exceeding 100". Others available upon request.
- Flange mount bushing system
- One piece die formed rim through 18"
- Rolled rim over 18"
- Available from stock

| QD Hub | A      | B       | Bushing | Max. Bore* | Screw Torque (in.-lb.) |

- Crown face pulleys will be provided unless straight face is specified
- These pulleys are designed to meet the CEMA Pulley Specification B105.1–1993. They are not to be used with steel cable belts or other high modulus belts.

# SELECTION/DIMENSIONS

## HE Heavy Duty Wing Pulleys

- Designed to CEMA specifications
- Standard crown face or straight face available
- 6" - 60" diameter and face widths exceeding 100". Others available upon request.
- HE bushing system designed specifically for Dodge conveyor pulleys
- Most dependable mounting system for conveyor pulleys
- Available with replaceable WING-LAG, vulcanized lagging, or replaceable weld-on strip lagging
- Available from stock

### HE Dimensions

| Hub  | A     | B    | Bushing | Max. Bore | Screw Torque (in.-lb.) |
|------|-------|------|---------|-----------|------------------------|
| HE25 | 1     | 1.80 | HE25    | 2-1/2     | 360                    |
| HE30 | 3/4   | 2.20 | HE30    | 3         | 720                    |
| HE35 | 3/4   | 2.78 | HE35    | 3-1/2     | 1080                   |
| HE40 | 3/4   | 2.93 | HE40    | 4         | 1680                   |
| HE45 | 3/4   | 3.20 | HE45    | 4-1/2     | 1680                   |
| HE50 | 3/4   | 3.70 | HE50    | 5         | 2400                   |
| HE60 | 1     | 3.95 | HE60    | 6         | 4200                   |
| HE70 | 1     | 4.45 | HE70    | 7         | 6000                   |
| HE80 | 1-1/4 | 5.20 | HE80    | 8         | 6000                   |

# SELECTION/DIMENSIONS

## TAPER-LOCK Heavy Duty Wing Pulleys

- Designed to CEMA specifications
- Standard crown face or straight face available
- 6" - 60" diameter and face widths exceeding 100". Others available upon request.
- Flush mount, compact design mounting system
- Available with replaceable WING-LAG, vulcanized lagging, or replaceable weld-on strip lagging
- Available from stock

# SELECTION/DIMENSIONS

## QD Heavy Duty Wing Pulleys

- Designed to CEMA specifications
- Standard crown face or straight face available
- 6" to 60" diameter and face widths exceeding 100". Others available upon request.
- Flange mount bushing system
- Available with replaceable WING-LAG, vulcanized lagging, or replaceable weld-on strip lagging
- Available from stock

## Mine Duty Extra Drum Pulleys

Mine Duty Extra Drum Pulley

Mine Duty Extra Drum Pulley

- Integral one-piece end discs are machined, drilled and tapped to accept bushing and bushing bolts, serving as the hub and end disc in one piece, eliminating the hub to end disc weld - the most common failure point on a conveyor pulley
- Standard crown face or straight face available
- 6" - 60" diameter and face widths exceeding 100". Others available upon request.
- HE bushing system - 14° taper - designed specifically for Dodge conveyor pulleys
- Greater capacity than standard competitors' mine duty pulleys
- Available in spiral drum construction
- Increased rim thickness over CEMA construction

## Mine Duty Extra Wing Pulleys

Mine Duty Extra Wing Pulleys were developed to support the most rugged wing pulley applications in the quarry and mining industries. These pulleys are designed with a rigid end disc design that incorporates our proven HE bushing system. They are designed to reduce wing folding by minimizing the wing height. The Mine Duty Extra Wing pulleys far exceed the product life expectancy of other wing pulleys.

- 3/4" x 2" contact bars
- 3/8" wing thickness
- Up to 25% more belt contact area
- 5" maximum wing height (through 42" OD)

### Options

- AR400 contact bars available upon request
- Weld-on strip lagging is also available upon request

# SELECTION

## Engineered Class Pulleys

A proven leader in its design and manufacturing - Dodge engineered class pulleys are custom-designed to the conveyor load, tensions, bearing centers and wrap angles of your application. They are supplied for belt ranges up to and exceeding 8000 pounds per inch of belt width. Finite element design, material certification, certified welding and technologically advanced lagging material assure you the exact pulley for your application.

- 14° HE bushings and hubs assure lowest bellows installation stress
- Integral hub and T-section pulleys minimize effects of welding in heat affected zones (HAZ)
- Keyless locking devices are offered for shafts up to 30" in diameter
- Full fillet welding of the internal center discs assure rugged reliability

# SELECTION

## Turbine Pulleys

### Turbine End Discs

Proprietary Software designs the rim, end disc, hub and shaft, and selects the locking assembly and bearings.

- All of the components designed as part of a dynamic system
- 3D Parametric Modeling and FEA are used in the design process
- Submerged Arc Welds
- No hub to end disc welds. This eliminates the most common failure point.
- Welds are Nondestructive Tested

Machining of the end disc increases the flexibility and reduces the bending moment carried by the locking assembly, hub, end disc, welds and rim.

### Single and Double Profile:

- Hub and end disc machined from 1 piece of steel
- Welds are on the inside of the rim at the end disc

### T-Section

- Hub, end disc, and part of rim all machined from 1 piece of steel
- Circumferential butt weld joins the center section of the rim to the rim that is part of the end disc
- Welds are in the rim in a lower stress area away from the rim to end disc connection

**Single Profile Design**

**Double Profile Design**

**T-Section Design**

# SELECTION/DIMENSIONS

## Elevator Pulleys

- Single or dual end disc design
- Heavy, all steel construction
- Economical alternative in narrow belt applications
- Standard crown face or available straight face
- HE compression hubs
- Various diameters and face widths available
- QD and TAPER-LOCK hubs and bushings also available
- CEMA or Mine Duty Construction
- Engineered also available

## Dead Shaft Pulleys

Our design incorporates two spherical roller piloted flange bearings within the end disc, instead of using our standard bushings. This allows the pulley to rotate, while keeping the support shaft stationary. The self-aligning bearings handle the shaft misalignment instead of transmitting it to the end discs. This design may be used where space is limited, and our traditional design may not fit. Dead shaft pulleys are more compact and may allow for smaller shaft diameters through the pulley.

-----  
**Piloted Flange Bearing End Disc**

# SELECTION

## Spiral Wing Pulleys

The Dodge Spiral Wing Pulley is available from 6" to 60" diameters and face widths exceeding 100". Our Spiral Wing Pulleys are formed using a flat bar that is helically wound around the pulley, with set intervals that helps to move excess material off the pulley. The spiral design allows constant contact with the belt, eliminating excessive noise and vibration, while still cleaning the belt. Our Spiral Wing pulley is available in numerous hub and bushing designs.

- Self Cleaning, maximizes belt life

## Spiral Drum Pulleys

The Dodge Spiral Drum Pulley is available from 12" to 60" diameters and face widths exceeding 100". It is formed using a vertical steel bar that is continuously wound around the pulley, with set intervals that helps to move excess material off the pulley. The spiral design allows constant contact with the belt, promoting the cleaning of the belt. Our Spiral Drum pulley is available in various hub and bushing designs.

## Magnetic Pulleys

Dodge Magnetic Drum Pulleys are available from 8-5/8" to 36" diameters. These Magnetic Drum Pulleys are supplied with straight face stainless steel rims and HE hubs and bushings. Magnetic Drum Pulleys continuously remove iron and ferrous particles from the conveyed material. All standard lagging options are available. For specific magnetic pulley requirements, please call the Dodge Conveyor Group.

## Stainless Steel Pulleys

Dodge Stainless Steel Pulleys are available from 6" to 60" diameters with face widths exceeding 100", in either crown or straight face. These pulleys can be supplied made completely from stainless steel for corrosive environments. Or it can be supplied with stainless steel rim and end discs and carbon steel hubs for use with magnetic separator. Stainless steel bushings and shafting can also be quoted. All standard lagging options are available.

## Steel Split Pulleys

- Applied in narrow belt applications
- Die formed, riveted construction
- Provides the best possible weight to strength ratio
- Interchangeable bushings for bores from 3/4” to 3-1/2”
- Available from stock
- Max speed = 500 ft/min
- Pulleys can be lagged with any standard lagging

# SELECTION

## Shafting

- Shafting up to 30" diameter, 22' in length
- Precision machined, custom designed
- C1045 turned and polished. Stocked through 5-15/16
- C1045 hot rolled 6" and above - to order
- 4140, 4340 and stainless steel available upon request
- Shafting can be keyed or journaled to meet any specification

## Conveyor Pulley Lagging

**Diamond Grooved**

Lagging pulley surfaces increases belt traction and eliminates rim wear due to abrasive conditions. In addition, it reduces buildup on the belt to help extend the service life.

Dodge offers lagging in 60 Durometer as standard, 70 and 45 are also available. Others available upon request.

A variety of different lagging styles are available.

- Plain
- Diamond grooved
- Chevron
- Herringbone
- Holz - replaceable slide on lagging can be installed or replaced with pulley installed. See page PT14-67 for more information
- Ceramic lagging
- Available in a wide variety of thicknesses

### Superior Lagging Materials

Standard material for Dodge lagging is Styrene-Butadiene Rubber (SBR). It provides excellent abrasion resistance, as well as resistance to heat, cutting, gouging and tearing.

### D-Lag

For maximum abrasion resistance, Dodge also offers D-Lag - a premium rubber polymer with 73% greater life than standard SBR. It offers improved resistance to cuts and gouges, as well as an improved coefficient of friction and low temperature flexibility.

### Neoprene

Dodge also offers MSHA-approved neoprene material, which is fire retardant and oil resistant.

### Wing-Lag

A replaceable urethane slide-on lagging for CEMA wing pulleys. See page PT14-68 for more information

**NOTE:** For weights of other lagging, multiply weight given above by factors listed below.

### 3/8", 1/2" Vulcanized Rubber Lagging Weight Factors

| Type       | Weight Factor | Type         | Weight Factor |
|------------|---------------|--------------|---------------|
| 3/8" Plain | 1.49          | 3/8" Grooved | 1.40          |
| 1/2" Plain | 1.99          | 1/2" Grooved | 1.89          |

## SLIDE LAG®

**Exclusive elastomer compounding** provides a lagging pad with exceptional drive-pulley traction, abrasion resistance and extra long service life.

**Factory hot-vulcanization** under pressure assures the best possible bond of rubber to backing plate. No lagging failures from loss of adhesion and separation-the most common problems associated with conventional lagging.

**Steel backing plates and metal retainers** are precision formed at the factory to fit the curved surface provided by each individual pulley diameter. Insures proper pad stability and long life.

**Replaceable** pads are designed to fit under the lips of the retainers, allowing the pads to slide in and out during installation. SLIDE LAG can be installed on conveyor systems without removing the pulleys from their operating positions

Different styles and materials of slide lag also available.

### Part Number for Style #5 SLIDE LAG

| Part Number | Description          |
|-------------|----------------------|
| 207349      | 6" Diameter Style 5  |
| 207325      | 8" Diameter Style 5  |
| 207326      | 10" Diameter Style 5 |
| 207327      | 12" Diameter Style 5 |
| 207328      | 14" Diameter Style 5 |
| 207329      | 16" Diameter Style 5 |
| 207330      | 18" Diameter Style 5 |
| 207331      | 20" Diameter Style 5 |
| 207332      | 24" Diameter Style 5 |
| 207333      | 30" Diameter Style 5 |
| 207334      | 36" Diameter Style 5 |
| 207335      | 42" Diameter Style 5 |

Other styles of SLIDE LAG are available upon request, such as Belt saver, Edge crown and SOF. Dodge conveyor pulleys can be readily obtained with SLIDE LAG pre-installed from the factory.

### Part Numbers for Holz Style # 5 SOF Slide Lagging

| Part Number | Description              |
|-------------|--------------------------|
| 207336      | 8" Diameter Style 5 SOF  |
| 207337      | 10" Diameter Style 5 SOF |
| 207338      | 12" Diameter Style 5 SOF |
| 207339      | 14" Diameter Style 5 SOF |
| 207340      | 16" Diameter Style 5 SOF |

# MODIFICATIONS/ ACCESSORIES

## WING-LAG™

A poly-elastomer material that improves the performance of conventional wing pulleys. Designed to beat the heat or cold...oil, chemicals or abrasives...for any tough conveyor operation where the job calls for lagged wing pulleys... WING-LAG will do the job better and last longer.

**Tougher than rubber.** WING-LAG will outlast rubber lagging 2-5 times.

**Resists chemicals and abrasives.** WING-LAG is not affected by most oils, hydraulic fluids, fuels, chemicals and abrasives.

**Excellent temperature range.** WING-LAG has an effective operating temperature range of -60 degrees F to +212 degrees F.

**WING-LAG grips the wing pulley** and stays in place as if it were glued. However, it requires no special metal channeling, retaining grooves or other designed-in retaining feature, therefore it goes on easily and removes easily.

Pulley with WING-LAG

Contact Bar

**Greater protection from foreign objects.** Because of its tough composition, rocks, coal chunks and other debris trapped between the conveyor belt and the wing will simply be thrown out when the pulley has completed its turn.

## Ordering WING-LAG

For the most common pulley sizes, select the number of the wings from the Table below. To calculate the number of 72" pieces needed, multiple the number of wings by the face width and divide by 72. Round the number of pieces up to the next largest number.

| Diameter | Heavy Duty No. of Wings | Part Number |
|----------|-------------------------|-------------|
| 8        | 7                       | 207300      |
| 10       | 8                       | 207300      |
| 12       | 8                       | 207300      |
| 14       | 10                      | 207300      |
| 16       | 10                      | 207300      |
| 18       | 10                      | 207300      |
| 20       | 10                      | 207301      |
| 24       | 12                      | 207301      |
| 30       | 16                      | 207301      |
| 36       | 18                      | 207301      |
| 42       | 22                      | 207301      |
| 48       | 24                      | 207301      |
| 54       | 28                      | 207301      |
| 60       | 30                      | 207301      |

WING-LAG is available on CEMA heavy duty wing pulleys with standard contact bars pre-installed at the factory or it can be retrofit in the field. Either way a WING-LAG wing pulley will extend the life of conveyor belts and conventional wing pulleys under the most severe operating conditions.

Only available on CEMA wings with standard contact bars.

Installation and maintenance instructions are available at [www.dodge-pt.com](http://www.dodge-pt.com)

## Conveyor Pulley Assemblies

- Single source supplier, single source warranty
- Computer aided product selection
- Maximize return on investment
- No on-site component assembly
- Complete package of all Dodge bearing and power transmission components, including pulleys, lagging, shafting and bearings, such as USAF, ISAF, IP-E, etc
- Coupling mounting is also available

## HE Bushings

The Dodge exclusive HE bushing system was specifically designed for drum and wing pulley applications.

- 14° taper angle to minimize end disc stress
- Thicker flange
- More mounting bolts on larger sizes
- Shaft diameters to 12"
- Even bolt spacing

### HE Bushing Dimensions

| Bushing | Maximum Bore (in.) | L (in.) | B.C. (in.) | F (in.) | H (in.) | Number of Bolts | Size of Bolts (in.) |

## RELATED PRODUCTS

### Keyless Locking Assemblies

The Dodge Pulley Pros have been designing and fabricating special pulleys with Keyless Locking Assemblies for over 30 years. Hubs are computer designed for use with single or dual locking assemblies.

Keyless locking assemblies are available in two basic configurations – short series and long series. Long series locking assemblies feature a longer length through bore with a corresponding increase in contact area between the locking assembly and the shaft and hub.

Most conveyor pulley applications require only one short series locking assembly in each pulley hub to transmit the bending and torsional moments. Heavier loaded pulleys require long series locking assemblies to transmit increased loads. The Dodge Pulley Pros have the experience and expertise to determine the best keyless locking assembly configuration for any application.

Dodge Keyless Locking Assemblies are self-contained, high torque capacity, shaft-hub locking devices. They provide many features and benefits to conveyor pulley assemblies, including no keyway stress concentration, no axial movement during assembly, high torque capacity, and easy assembly and disassembly. The locking assembly design includes concentric, tapered rings. As the locking screws are torqued, the locking assembly clamps down on the shaft and expands into the hub bore, establishing a tight mechanical shrink fit.

**Long Series Locking Assembly**

**Short Series**

**Long Series Locking Assembly**

Available in Weld On Hub, Integral Hub or T-Section. See Pages PT14-56 and PT14-57.

# ENGINEERING/TECHNICAL

## Horsepower and Belt Tension for Simple Conveyors \*

### Horsepower

The horsepower required to operate a belt conveyor depends on the following:

1. Maximum tonnage to be handled
2. Length of the conveyor
3. Vertical lift of the conveyor

To determine horsepower required for a horizontal conveyor, use Table 1 only.

To determine horsepower required for an inclined conveyor, use Table 1 and Table 2. Figure each table separately and sum the results to determine total horsepower required.

**Note:** Other factors, such as conveyor plows, scrapers, and skirt boards over 12 feet, will require additional factors for horsepower.

See conveyor design program or call conveyor component engineering for assistance.

\* These calculations are limited to level or uphill conveyors with single drive pulley and a maximum length of 500 ft. For other systems, consult Dodge.

**NOTE:** Online selection program is available at [www.ptwizard.com](http://www.ptwizard.com)

**Table 1 – HP Required to Operate Loaded Conveyor on the Level**

| Length of Conveyor in feet | Short Tons Per Hour (2000 lbs.) |     |      |      |      |      |      |      |      |      |      |      |      |

### Belt Tension:

The belt tensions developed in a belt conveyor depend on the following:

1. Motor horsepower
2. Belt speed in feet per minute
3. Drive configuration

To determine tight side (T1) and slack side (T2) operating tensions, first determine the effective tension (difference between T1 and T2) from:  $T_e = 33,000 \times \text{HP}/\text{FPM}$

Where:  $T_e$  = Effective tension  
 $\text{HP}$  = Motor horsepower  
 $\text{FPM}$  = Belt speed

The slack side belt tension is calculated from  $T_e$  and the drive factor  $C_w$  (from Table 7) by:  $T_2 = T_e \times C_w$

Where:  $T_2$  = Slack side tension  
 $T_e$  = Effective tension  
 $C_w$  = Drive factor from Table 3

The tight side tension is calculated from  $T_e$  and  $T_2$  by:  $T_1 = T_e + T_2$

Where:  $T_1$  = Tight side tension  
 $T_e$  = Effective tension  
 $T_2$  = Slack side tension

#### Example: Horsepower and Tension calculation

Calculate horsepower and belt tensions for a conveyor given:

1. Capacity of 300 tons per hour
2. 300 ft. conveyor length
3. 20 ft. conveyor lift
4. Belt speed of 450 feet per minute
5. Screw take-up system
6. 180° arc of contact on drive pulley
7. Lagged drive pulley

#### Horsepower:

From Table 1 the horsepower required to operate the belt on the level is 8.4. From Table 2 the horsepower required for lift is 6.0. The total horsepower required is  $8.4 + 6.0 = 14.4$ . (A 15 HP motor would be selected.)

#### Tension:

First calculate effective tension from:

$$T_e = \frac{33000 \times \text{HP}}{\text{FPM}} \qquad T_e = \frac{33000 \times 15}{450} = 1100 \text{ lbs.}$$

Calculate  $T_2$  from  $T_e$  and drive factor  $C_w$  (From Table 3  $C_w = .8$ )

$$T_2 = C_w \times T_e \qquad T_2 = .8 \times 1100 = 880 \text{ lbs.}$$

Finally calculate  $T_1$  from  $T_2$  and  $T_e$

$$T_1 = T_2 + T_e \qquad T_1 = 880 + 1100 = 1980 \text{ lbs.}$$

**Table 3 - Drive Factor**

| Type of Pulley Drive | Wrap | Automatic Take-Up |               | Manual Take-Up |               |
|----------------------|------|-------------------|---------------|----------------|---------------|
|                      |      | Bare Pulley       | Lagged Pulley | Bare Pulley    | Lagged Pulley |
| Single no snub       | 180° | 0.84              | 0.50          | 1.2            | 0.8           |
| Single with snub     | 200° | 0.72              | 0.42          | 1.0            | 0.7           |
|                      | 210° | 0.66              | 0.38          | 1.0            | 0.7           |
|                      | 220° | 0.62              | 0.35          | 0.9            | 0.6           |
|                      | 240° | 0.54              | 0.30          | 0.8            | 0.6           |

## Vibration Frequencies of DODGE Anti-Friction Mounted Bearings

More and more manufacturing facilities are getting involved with plant-wide preventive maintenance programs. By monitoring vibration levels of motors, pumps, fans and compressors, maintenance supervisors can predict imminent failures. Knowing that a piece of equipment is showing signs of potential failure permits scheduling of maintenance at an appropriate time and avoids the consequences of catastrophic failures. Shown in Tables 1 - 10 are vibration frequencies generated by bearing components defects. All frequencies are based on unity inner ring or cone rotation.

### How to Use the Tables

If a 2-7/16 Type E pillow block is rotating at 1000 RPM, the vibration due to a failed component will show up at the following frequencies: (Table 3, Line 6)

### Frequency

|   |                    |            |
|---|--------------------|------------|
| Cup Nick or Spall                               | = 1000 x 9.251     | = 9251 RPM |
| Cone Nick or Spall                              | = 1000 x 11.749    | = 11749 PM |
| *Roller Nick or Spall                           | = 1000 x 4.011 x 2 | = 8022 RPM |
| Cage (Train) Frequency<br>(Inner Ring Rotation) | = 1000 x 0.441     | = 441 RPM  |

Since all the values in Tables 1 - 10 are based on unity inner ring or cone rotation, the vibration due to flaws will show up at the frequencies obtained by multiplying the RPM times the factors found on the appropriate table. The resulting product will have units of RPM.

**Table 1: All Setscrew, Eccentric, D-LOK & GT Ball Bearing Parameters For Vibration Analysis (1-RPS)**

| Series | SC Bore         | SCM Bore        | # Balls | Diameter of Balls | Pitch Diameter | Outer Ring Frequency Hz | Inner Ring Frequency Hz | * Ball Spin Frequency Hz | Cage Frequency Hz |

| 4-7/16 - 4-1/2   | 33                | 0.46                     | 3.109          | 11.50         | 14.108           | 18.892            | 3.308                      | 0.428             |
| 4-15/16 - 5      | 26                | 0.68                     | 6.983          | 18.00         | 11.796           | 14.204            | 5.091                      | 0.4537            |

$$\text{Cup Frequency} = N * \text{RPM} * (1 - (\text{Bd} * \cos a / \text{Pd})) / 120$$

$$\text{Cone Frequency} = N * \text{RPM} * (1 + (\text{Bd} * \cos a / \text{Pd})) / 120$$

$$\text{Roller Spin Frequency} = \text{Pd} * \text{RPM} * (1 - (\text{Bd} * \cos a / \text{Pd})^2) / (120 * \text{Bd})$$

$$\text{Cage Frequency} = \text{RPM} * (1 - (\text{Bd} * \cos a / \text{Pd})) / 120$$

Pd = Pitch Diameter

N = Number of rollers

Bd = Roller Diameter

a = Cup Angle (contact angle)

**\* Note:** Ball and Roller Spin Frequencies are listed at one (1X) roller spin frequency. For thorough analysis it is important to check frequency level at two (2X) rotational speed of balls or rollers as this is the frequency that a single ball/roller defect will contact the raceways of the bearing. In other words, a ball/roller defect will strike both inner and outer ring in one revolution of the roller.

## Type 4: Special Duty Tapered Roller Bearing Parameters For Vibration Analysis (1-RPS)

| Bore Size      | # Rollers Per Row | Mean Diameter of Rollers | Pitch Diameter | Contact Angle | Cup Frequency Hz | Cone Frequency Hz | Roller Spin Frequency Hz | Cage Frequency Hz |
|----------------|-------------------|--------------------------|----------------|---------------|------------------|-------------------|--------------------------|-------------------|

N = Number of rollers

Bd = Roller Diameter

a = Cup Angle (contact angle)

## Table 5: All Steel Tapered Roller Bearing Parameters For Vibration Analysis (1-RPS)

| Bore Size      | # Rollers Per Row | Mean Diameter of Rollers | Pitch Diameter | Contact Angle | Cup Frequency Hz | Cone Frequency Hz | * Roller Spin Frequency Hz | Cage Frequency Hz |
|----------------|-------------------|--------------------------|----------------|---------------|------------------|-------------------|----------------------------|-------------------|
| 2-11/16 - 3    | 27                | 0.36                     | 4.114          | 15.50         | 12.362           | 14.638            | 5.673                      | 0.458             |
| 3-1/4 - 3-1/2  | 26                | 0.51                     | 5.120          | 17.57         | 11.766           | 14.235            | 4.974                      | 0.453             |
| 3-15/16 - 4    | 33                | 0.48                     | 5.814          | 12.50         | 15.170           | 17.830            | 6.017                      | 0.460             |
| 4-7/16 - 4-1/2 | 29                | 0.60                     | 6.503          | 12.92         | 13.196           | 15.804            | 5.375                      | 0.455             |
| 4-15/16 - 5    | 32                | 0.61                     | 7.355          | 12.50         | 14.705           | 17.296            | 5.989                      | 0.460             |
| 5-7/16         | 27                | 0.84                     | 8.272          | 12.00         | 12.159           | 14.841            | 4.875                      | 0.450             |
| 5-15/16 - 6    | 26                | 0.85                     | 8.323          | 12.00         | 11.701           | 14.300            | 4.847                      | 0.450             |
| 6-7/16 - 7     | 32                | 0.81                     | 9.748          | 12.50         | 14.702           | 17.300            | 5.978                      | 0.459             |
| 7-1/2 - 8      | 27                | 1.12                     | 11.471         | 12.42         | 12.213           | 14.787            | 5.074                      | 0.452             |
| 9 - 10         | 32                | 1.28                     | 14.026         | 12.03         | 14.572           | 17.428            | 5.435                      | 0.455             |

$$\text{Cup Frequency} = N * \text{RPM} * (1 - (\text{Bd} * \cos a / \text{Pd})) / 120$$

$$\text{Cone Frequency} = N * \text{RPM} * (1 + (\text{Bd} * \cos a / \text{Pd})) / 120$$

$$\text{Roller Spin Frequency} = \text{Pd} * \text{RPM} * (1 - (\text{Bd} * \cos a / \text{Pd})^2) / (120 * \text{Bd})$$

$$\text{Cage Frequency} = \text{RPM} * (1 - (\text{Bd} * \cos a / \text{Pd})) / 120$$

Pd = Pitch Diameter

N = Number of rollers

Bd = Roller Diameter

a = Cup Angle (contact angle)

**\* Note:** Ball and Roller Spin Frequencies are listed at one (1X) roller spin frequency. For thorough analysis it is important to check frequency level at two (2X) rotational speed of balls or rollers as this is the frequency that a single ball/roller defect will contact the raceways of the bearing. In other words, a ball/roller defect will strike both inner and outer ring in one revolution of the roller.

**Table 6: S-2000, Unisphere II and Imperial Spherical Roller Bearing Parameters for Vibration Analysis (1-RPS)**

| Basic Bearing Series | S-2000 Bore Size (in) | Unisphere II Bore Size (in) | Imperial Bore Size (in) | No. of Rollers | Mean Dia. Of Rollers | Pitch Dia. | Contact Angle | Outer Ring Frequency Hz | Inner Ring Frequency Hz | * Roller Spin Frequency Hz | Cage Frequency Hz |

\* **Note:** Ball and Roller Spin Frequencies are listed at one (1X) roller spin frequency. For thorough analysis it is important to check frequency level at two (2X) rotational speed of balls or rollers as this is the frequency that a single ball/roller defect will contact the raceways of the bearing. In other words, a ball/roller defect will strike both inner and outer ring in one revolution of the roller.

**Table 8: DODGE USAF Air Handling Spherical Roller Bearing Parameters For Vibration Analysis (1-RPS)**

| Bore Size       | Basic Bearing Series | # Rollers Per Row | Diameter of Rollers | Pitch Diameter | Contact Angle | Outer Ring Frequency Hz | Inner Ring Frequency Hz | *Roller Spin Frequency Hz | Cage Frequency Hz |

 Outer Ring Frequency =  $N * RPM * (1 - (Bd * \cos a / Pd)) / 120$ 

 Inner Ring Frequency =  $N * RPM * (1 + (Bd * \cos a / Pd)) / 120$ 

 Roller Spin Frequency =  $Pd * RPM * (1 - (Bd * \cos a / Pd)^2) / (120 * Bd)$ 

 Cage Frequency =  $RPM * (1 - (Bd * \cos a / Pd)) / 120$ 

Pd = Pitch Diameter

N = Number of rollers

Bd = Roller Diameter

a = Contact Angle

**\* Note:** Ball and Roller Spin Frequencies are listed at one (1X) roller spin frequency. For thorough analysis it is important to check frequency level at two (2X) rotational speed of balls or rollers as this is the frequency that a single ball/roller defect will contact the raceways of the bearing. In other words, a ball/roller defect will strike both inner and outer ring in one revolution of the roller.

**Table 10: USDAF Spherical Roller Bearing Parameters For Vibration Analysis (1-RPS)**

| Bore Size         | Basic Bearing Series | # Rollers Per Row | Diameter of Rollers | Pitch Diameter | Contact Angle | Outer Ring Frequency Hz | Inner Ring Frequency Hz | * Roller Spin Frequency Hz | Cage Frequency Hz |

Outer Ring Frequency =  $N * RPM * (1 - (Bd * \cos a / Pd)) / 120$

Inner Ring Frequency =  $N * RPM * (1 + (Bd * \cos a / Pd)) / 120$

Roller Spin Frequency =  $Pd * RPM * (1 - (Bd * \cos a / Pd)^2) / (120 * Bd)$

Cage Frequency =  $RPM * (1 - (Bd * \cos a / Pd)) / 120$

Pd = Pitch Diameter

N = Number of rollers

Bd = Roller Diameter

a = Contact Angle

**\* Note:** Ball and Roller Spin Frequencies are listed at one (1X) roller spin frequency. For thorough analysis it is important to check frequency level at two (2X) rotational speed of balls or rollers as this is the frequency that a single ball/roller defect will contact the raceways of the bearing. In other words, a ball/roller defect will strike both inner and outer ring in one revolution of the roller.

## Mounted Bearings Life Adjustment Factor

**1.1 GENERAL.** For certain applications, it is desirable to specify life for reliability other than 90%. In such cases a life adjustment factor for reliability may be applied to the RATING LIFE. Section 1.2 discusses life adjustment factors for reliability.

Some bearing steels; e.g., vacuum-melted steels, and improved processing techniques, permit manufacture of bearings which offer endurance greater than that calculated by the RATING LIFE formula. Section 1.3 recommends methods to incorporate life adjustment factors for bearing materials into the life formula.

Bearing life calculated according to the RATING LIFE formula assumes proper application conditions. If lubrication is not adequate, loading unusual, or temperatures extreme, the ability of the bearing to attain or exceed the RATING LIFE is seriously impaired. Section 1.4 contains some basic recommendations concerning the effect of unusual application conditions on bearing life.

**1.2 LIFE ADJUSTMENT FACTOR FOR RELIABILITY.** Bearing life estimated in accordance with this standard is RATING LIFE; i.e., the life associated With 90% reliability or the life which 90% of a group of apparently identical bearings in a given application under similar conditions of load and speed will complete or exceed. While RATING LIFE has proven useful over a period of years as a criterion of performance, some applications require definition of life at reliabilities greater than 90%.

To determine bearing life with reliabilities other than 90% (as previously calculated in the Selection Procedure) the  $L_{10}$  must be adjusted by factor  $a_1$ , such that  $L_n = a_1 \times L_{10}$ .

The life adjustment factors for reliability from Table 11 are recommended.

**Table 11: Life Adjustment Factors For Reliability**

| Reliability % | $L_n$    | Life Adjustment Factor for Reliability $a_1$ |
|---------------|----------|--|
| 90            | $L_{10}$ | 1  |
| 95            | $L_5$    | 0.62   |
| 96            | $L_4$    | 0.53   |
| 97            | $L_3$    | 0.44   |
| 98            | $L_2$    | 0.33   |
| 99            | $L_1$    | 0.21   |

**1.3 LIFE ADJUSTMENT FACTOR FOR MATERIAL.** For bearings, which incorporate improved materials and processing, the  $L_{10}$  (as previously calculated in the Selection Procedure) must be adjusted by factor  $a_2$ . Factor  $a_2$  depends upon steel analysis, metallurgical processing, forming methods, heat treatment and manufacturing methods in general.

Bearings fabricated from consumable vacuum remelted steels and certain other special analysis steels have demonstrated extraordinarily long endurance. These steels are of exceptionally high quality, and bearings fabricated from these are usually considered special manufacture. As such,  $a_2$  values will not be specified for such steels in this discussion. Generally,  $a_2$  values for such steels can be obtained from the bearing manufacturer.

## Mounted Bearings Life Adjustment Factor

### 1.4 LIFE ADJUSTMENT FACTOR FOR APPLICATION

**CONDITIONS.** Application conditions which affect bearing life include:

1. Lubrication.
2. Load distribution (including effects of clearance, misalignment, housing, and shaft stiffness, type of loading and thermal gradients).
3. Temperature.

Consideration of (1.2) and (1.3) above requires analytical and experimental techniques beyond the scope of this discussion, therefore, the user should consult the bearing manufacturer for evaluations and recommendations.

In most bearing applications, lubrication serves to separate the rolling surfaces; i.e., rolling elements and raceways; to reduce retainer-rolling elements and retainer-land friction and sometimes to act as a coolant to remove frictional heat generated by the bearing.

If all limitations and qualifications specified by this discussion are observed, then the life adjustment application factor for bearings which are adequately lubricated is 1; i.e.,  $a_3=1$ .

Operating conditions where  $a_3$  might be less than 1 include:

- a) exceptionally low values of  $N_{dm}$  (rpm times bore diameter in mm); e.g.,  $N_{dm}$  1000.
  - b) Lubricant viscosity less than 20.4 centistokes (100 SUS) at operating temperature.
  - c) Excessively high operating temperatures.
- When  $a_3$  is less than 1, it may not be assumed that the deficiency in lubrication can be overcome by using an improved steel.

**1.5 FACTOR COMBINATIONS.** A fatigue life formula including the life adjustment factors is:

Ball Bearings:

$$L_n = a_1 \times a_2 \times a_3 \left( \frac{C^*}{P} \right)^3 \times \frac{(16.667)}{\text{RPM}}$$

Tapered Roller Bearings:

$$L_n = a_1 \times a_2 \times a_3 \left( \frac{C_{90}^*}{P} \right) \times \frac{(1,500,000)}{\text{RPM}}$$

Spherical Roller Bearings:

$$L_n = a_1 \times a_2 \times a_3 \left( \frac{C^*}{P} \right)^{10/3} \times \frac{(16.667)}{\text{RPM}}$$

Indiscriminate application of the life adjustment factors in this formula may lead to serious over-estimation of bearing endurance, since fatigue life is only one criterion for bearing selection.

Care must be exercised to select bearings which are of sufficient size for the application. Undersizing of shaft and housing structures by using bearings which appear adequate from a life standpoint could lead to misalignment and fitting problems which could invalidate the formulas in this discussion.

\* C = Basic Load Rating computed in accordance with ABMA-ANSI Standards.  $C_{90} = C \times .259$

# ENGINEERING

## V-Belt Drive Formulas

**V-belt tensioning** In cases where tensioning of a drive effects belt pull and bearing loads, the following formulas may be used.

$$T_1 - T_2 = 33,000 \left( \frac{HP}{V} \right)$$

where:  $T_1$  = tight side tension, pounds  
 $T_2$  = slack side tension, pounds  
 HP = design horsepower  
 V = belt speed, feet per minute

$$T_1 + T_2 = 33,000 (2.5-G) \left( \frac{HP}{GV} \right)$$

where:  $T_1$  = tight side tension, pounds  
 $T_2$  = slack side tension, pounds  
 HP = design horsepower  
 V = belt speed, feet per minute  
 G = arc of contact correction factor\*

$$T_1/T_2 = \frac{1}{1-0.8G} \quad (\text{Also } T_1/T_2 = e^{K\theta})$$

where:  $T_1$  = tight side tension, pounds  
 $T_2$  = slack side tension, pounds  
 G = arc of contact correction factor\*  
 e = base of natural logarithms  
 K = .51230, a constant for V-belt drive design  
 $\theta$  = arc of contact in radians

$$T_1 = 41,250 (HP/GV)$$

where:  $T_1$  = tight side tension, pounds  
 HP = design horsepower  
 V = belt speed, feet per minute  
 G = arc of contact correction factor

$$T_2 = 33,000 (1.25-G) (HP/GV)$$

where:  $T_2$  = slack side tension, pounds  
 HP = design horsepower  
 V = belt speed, feet per minute  
 G = arc of contact correction factor

### Belt Speed

$$V = \frac{(PD) (RPM)}{3.82} = (PD) (rpm) (.262)$$

where: V = belt speed, feet per minute  
 PD = pitch diameter of sheave or pulley  
 rpm = revolutions per minute of the same sheave or pulley

\* See Table 12 at left

**Table 12: Arc of Contact Correction Factor G**

| D-d<br>C | Small Sheave Arc of Contact | Factor G | D-d<br>C | Small Sheave Arc of Contact | Factor G |
|----------|-----------------------------|----------|----------|-----------------------------|----------|
| .00      | 180°                        | 1.00     | .80      | 133°                        | .87      |
| .10      | 174°                        | .99      | .90      | 127°                        | .85      |
| .20      | 169°                        | .97      | 1.00     | 120°                        | .82      |
| .30      | 163°                        | .96      | 1.10     | 130°                        | .80      |
| .40      | 157°                        | .94      | 1.20     | 106°                        | .77      |
| .50      | 151°                        | .93      | 1.30     | 99°                         | .73      |
| .60      | 145°                        | .91      | 1.40     | 91°                         | .70      |
| .70      | 139°                        | .89      | 1.50     | 83°                         | .65      |

D = Diam. of large sheave. d = Diam. of small sheave  
 C = Center distance

**Table 13: Allowable Sheave Rim Speed**

| Sheave Material | Rim Speed in Feet per Minute |
|-----------------|------------------------------|
| Cast Iron       | 6,500                        |
| Ductile Iron    | 8,000                        |
| Steel           | 10,000                       |

**NOTE:** Above rim speed values are maximum for normal considerations. In some cases these values may be exceeded. Consult factory and include complete details of proposed application.

$$\text{Dynamic balance RPM for Sheave/Sprocket } \diamond = \frac{15600}{\sqrt{\text{Dia} \times \text{Face Width}}}$$

$\diamond$  **Note:** MPTA recommends Dynamic balance when application RPM exceeds this value.

### Bearing Load Calculations

To find actual bearing loads, it is necessary to know machine component weights and values of all other forces contributing to the load. Sometimes it becomes desirable to know the bearing load imposed by the V-belt drive

#### Overhung Sheave

$$\text{Load at B, lbs.} = \frac{\text{Shaft Load} \times (a + b)}{a}$$

$$\text{Load at A, lbs.} = \text{Shaft Load} \times \frac{b}{a}$$

Where: a and b = Spacing, inches

alone. This can be done if you know bearing spacing with respect to the sheave center and shaft load and apply it to the following formulas:

#### Sheave Between Bearings

$$\text{Load at D, lbs.} = \frac{\text{Shaft Load} \times c}{c + d}$$

$$\text{Load at C, lbs.} = \frac{\text{Shaft Load} \times d}{c + d}$$

Where: c and d = Spacing, inches

## Nominal V-Belt Cross Sections

**Table 14: Nominal V-Belt Cross Sections**

| Belt Section | Industry Standard Description | Width W, in Inches | Thickness T, in Inches |
|--------------|-------------------------------|--------------------|------------------------|
| 3L           | FHP, Single                   | 3/8                | 7/32                   |
| 4L           |                               | 1/2                | 5/16                   |
| 5L           |                               | 21/32              | 3/8                    |
| 3V           | Narrow                        | 3/8                | 5/16                   |
| 5V           |                               | 5/8                | 17/32                  |
| 8V           |                               | 1                  | 29/32                  |
| A            | Classical Multiple            | 1/2                | 5/16                   |
| B            |                               | 21/32              | 13/32                  |
| C            |                               | 7/8                | 17/32                  |
| D            |                               | 1-1/4              | 3/4                    |

## Shafting

**Table 17: Typical Commercial Shaft Tolerances**

| Shaft Size           | Plus | Minus |
|----------------------|------|-------|
| Up to 1-1/2"         | .000 | .002  |
| Over 1-1/2 to 2-1/2" | .000 | .003  |
| Over 2-1/2 to 4"     | .000 | .004  |
| Over 4 to 6"         | .000 | .005  |
| Over 6 to 8"         | .000 | .006  |
| Over 8 to 9"         | .000 | .007  |
| Over 9"              | .000 | .008  |

**Table 18: Shaft Tolerances**

| Shaft Size   | Tolerance, Inches |
|--------------|-------------------|
| Up to 1-1/2" | +.0000 -.0005"    |
| 1-5/8 to 4"  | +.000 -.001"      |
| 4-7/16 to 6" | +.000 -.0015"     |
| 6-7/16 to 8" | +.000 -.002"      |

Table 18 lists the recommended tolerances for all setscrew locking, eccentric locking and D-LOK locking ball and roller bearings

**Table 19: Shaft Tolerances**

| Shaft Size        | Tolerance, Inches |
|-------------------|-------------------|
| Up to 1-1/2"      | +.000 -.002"      |
| 1-9/16 to 2-1/2"  | +.000 -.003"      |
| 2-5/8 to 4"       | +.000 -.004"      |
| 4-3/16 to 6"      | +.000 -.005"      |
| 6-7/16" and above | +.000 -.006"      |

Table 19 list the recommended tolerances for all tapered adapter sleeve ball and roller bearings

**Standard Shafting** – Table 17 indicates standard shafting is cold drawn in the smaller sizes and turned and polished in the larger diameters. It has a smooth surface, is commercially straight and is readily machinable; suitable and recommended for general power transmission and material handling service.

**Special Shafting** – While standard shafting is suitable for most installations, special shafting is sometimes required for certain chemical, temperature or physical requirements. Such materials as high carbon steel, alloy steel, stainless steel, brass, Monel metal, etc., can be furnished plain or heat treated. Stepped, flanged, hollow or other special forms are available.

Special shafting should be avoided in favor of standard shafting wherever possible because special shafting is usually considerably more expensive and requires a greater length of time to obtain, which is an especially important consideration should quick replacement ever become necessary.

**Ordering Shafting** – Standard shafting can be obtained from most supply houses and dealers who handle power transmission material.

**Turning Down Shaft Ends** – When necessary to turn down shaft ends, use as large a fillet as possible to keep the stress concentration to a minimum. The radius of this fillet should preferably be not less than the difference in the two diameters joined by the fillet. The fillet should be finished and polished as smoothly as possible to avoid scratches which might start cracks and lead to failure of the shaft by fatigue.

## Selection of Shaft Diameters

Tables 21 - 24 inclusive can be used to find approximate shaft diameter for various service conditions For greater accuracy use chart under heading "Combined Torsion and Bending of Standard Shafts" (PT15-18).

Tables and chart are based upon a safe shear stress of 6,000 pounds per square inch for standard keyseated shafting. Be generous in the selection of shaft diameters as liberal diameters not only reduce deflection and vibration but also generally increase bearing life.

When necessary to use other than standard shafting, find the required diameter for standard shafting as outlined above and multiply by proper factor shown in Table 25, under heading "Factors for Shafting Other than Standard Shafting," on page PT15-17.

**Table 20: No Bending Moment (Shafts without pulleys, sprockets or gears - Torsion only)**

| Shaft Size | Horse Power at Various Revolutions per Minute |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|------------|---|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
|            | 25  | 50    | 75    | 100   | 125   | 150   | 175   | 200   | 225   | 250   | 275   | 300   | 350   | 400   | 500   | 600   | 700   | 800   | 900   |

**Caution:** Be generous in the selection of shaft diameters as liberal diameters not only reduce deflection and vibration but also generally increase bearing life. See notes on next page.

## Selection of Shaft Diameters (Cont'd)

**Shaft Stiffness, Shaft Deflection** – Standard shafting of adequate strength usually has a sufficiently large diameter to prevent excessive deflection in ordinary installations. It is wise to select shafting of generous diameter, as the greater the diameter, the greater the stiffness. A high tensile strength alloy shaft, although stronger, is no stiffer than a standard shaft of the same diameter.

While it is sometimes possible to use an alloy shaft of less diameter than a standard shaft of equal strength, this practice is usually inadvisable, as the deflection is increased.

Shafts carrying medium or long clutch sleeves should be especially generous.

**High Speed Shafts** – High speed sometimes causes shaft whipping or vibration. This can be prevented by making the shaft diameter generous and the distance between bearing centers short.

Location of the bearings close to wheels and couplings is advisable whether the shaft is transmitting heavy or light loads.

The use of high tensile strength alloy shafting instead of standard shafting is of no help in preventing vibration as this will not improve the stiffness nor deflection characteristics of the shaft.

**Stepped Shafts** – For a heavily loaded wheel, a shaft with a boss or enlarged section under the wheel and turned to a smaller diameter at the bearings often provides the most economical installation. The two different diameters should be joined by a very generous fillet, otherwise a dangerous concentration of stress will occur at the fillet. See heading – “Turning Down Shaft Ends.” on page PT15-14.

**Shaft Keyseats** – Plain keyseats are preferable to round end keyseats in respect to causing the least concentration of stress. However, round end keyseats are often used because of design and assembly requirements. Ends left by the milling cutter should not project into babbitted or bronze bushed bearing, but may project under the sleeve of any DODGE anti-friction bearing.

Shaft diameters obtained from the tables or chart allow for the use of keyseats.

**Shaft Bearings** – On ordinary line shafting, bearings are commonly spaced about eight feet centers. On large diameter shafts, the spacing may be somewhat greater.

Wheels and clutches should be located near bearings to avoid dangerous bending, deflection and vibration.

Bearings should be mounted on adequate supports so that accurate alignment may be maintained. Shaft misalignment may cause shaft or bearing failure.

**Shaft Couplings** – Where a rigid coupling is used, it is preferable to have a bearing fairly close. Where a cutoff coupling or a flexible coupling is used, locate bearings close to each end of the coupling.

**Expansion of Shafting** – Where changes in the length of the shaft due to changes in temperature are to be expected and the bearings are mounted on supporting structures other than steel, consideration must be given to expansion. For more detailed information see page PT15-19, headed “Expansion of Shafting.”

## Factors for Shafting Other Than Standard Shafting

When it is necessary to use other than standard shafting, multiply required diameter for standard shafting as found in the tables or chart by proper factor from Table 24 below.

Standard keyseated shafting, using a safe shear stress of 6,000 PSI is the basis of shafting tables and chart. For safe shear stress of other materials, use 1/10 of nominal ultimate tensile strength. For example, use 8,000 for C1045 and 10,000 for 4140 keyseated shafting. When definite physical specifications are known the least of 13.5% of minimum ultimate tensile strength and 22.5% of minimum elastic limit in tension may be used for keyseated shafting; 18% and 30% respectively if not keyseated.

**Caution** – As the deflection of steel shafting depends upon the diameter and not upon the analysis of the steel, care should be exercised in the use of alloy shafting not to reduce the diameter unduly. Deflection should not be excessive and bearing capacities should be adequate. It is usually best to use standard shafting instead of a smaller diameter alloy shaft. The smaller alloy shaft may safely transmit the torque but often is undesirable in respect to deflection, vibration and bearing life

**Table 24: Shear Stress Factors**

| Safe Shear Stress | Factor | Safe Shear Stress | Factor | Safe Shear Stress | Factor | Safe Shear Stress | Factor | Safe Shear Stress | Factor |
|-------------------|--------|-------------------|--------|-------------------|--------|-------------------|--------|-------------------|--------|
| 500               | 2.289  | 3,000             | 1.260  | 5,500             | 1.029  | 9,000             | .874   | 14,000            | .754   |
| 1,000             | 1.817  | 3,500             | 1.197  | 6,000             | 1.000  | 10,000            | .843   | 15,000            | .737   |
| 1,500             | 1.587  | 4,000             | 1.145  | 6,500             | .974   | 11,000            | .817   | 16,000            | .721   |
| 2,000             | 1.442  | 4,500             | 1.101  | 7,000             | .950   | 12,000            | .794   | 17,000            | .707   |
| 2,500             | 1.339  | 5,000             | 1.063  | 8,000             | .909   | 13,000            | .773   | 18,000            | .693   |

# ENGINEERING

## Combined Torsion and Bending of Standard Shaft (Based on a Safe Shear Stress of 6,000 PS for Keyseated Shafting)

**Example:** Engine extension shaft driving single cylinder compressor, 15,000 pound-inches torsional moment, 14,000 pound- inches bending moment. Because of the heavy shock running load conditions use scales designated “Light or Heavy Starting and Severe Shock Running”. Project a line down from 15,000 torsional moment. Project a line to the right from 14,000 bending moment. The two lines intersect between 3-7/16 and 3-15/16 curves. Use 3-15/16 standard shafting.

**Note:** The above chart is based on ASME approved standard ASA-B17C-1927 withdrawn in 1954. If the latest shaft selection analysis is required refer to ANSI/ASME B106.1M-1985.

**Note:** If considering use of other shafting material refer to “Selection of Shaft Diameters” on page B15-15.

## Expansion of Shafting

Provision should be made to permit the free movement of shafting endwise due to temperature changes. One bearing should serve as an anchor bearing to locate the shaft endwise. All other bearings should permit the shaft to move freely endwise.

The anchor bearing is often located near an important wheel. On long shafts it should preferably be located near the center of the shaft to keep the expansion of the two ends to a minimum. If the anchor bearing is babbitted it should be fitted with collars. If it is an anti-friction bearing it should be of the non-expansion type, which is the designation of DODGE roller and ball bearings for use as anchor bearings.

All bearings on the shafting other than the anchor bearing should permit the shaft to move freely endwise. If babbitted there should be no thrust collars. If anti-friction these bearings should be of the expansion type.

Several shafts firmly fastened together expand as if one continuous shaft. An example of this is line shafting with flange couplings. If the expansion is considered excessive a long line shaft may be split into two or more sections, the sections being connected with expansion couplings.

### Amount of Expansion to be provided for –

The amount of shaft expansion is given in Table 25 below. For example, with a 100°F temperature rise on a 150 ft. line shaft with the anchor bearing located 70 ft. from one end and 80 ft. from the other end the ends will move .529” and .605” respectively away from the anchor bearing. The structure supporting the bearings may also expand but usually not as rapidly and as much as the shafting. Several cases follow:

**Case 1** – Bearings supported on steel structures, where the shaft and structure are exposed to the same temperatures, will expand at the same rate. Expansion allowance is usually not required. If the shaft is exposed to a higher temperature than the support, allowances should be made. For example, if the shaft temperature is expected to change 80°, and the temperature of the structure 60°, the resulting movement between shafting and support ends will be equivalent to a 20° change.

**Case 2** – For bearings supported on wood, brick, or concrete walls, or on piers with foundations in the ground, the amount of expansion is usually considered negligible. Therefore, the full amount of shafting expansion as calculated in Table 25 below, may be accommodated.

**Case 3** – Certain structural designs have built-in flexibility. Where this is the case, expansion type bearings are not necessary.

**Case 4** – Short shafts with only two bearings are usually designed without compensation for expansion, if temperature variations are not excessive.

### Advice on Expansion Problems –

DODGE power transmission engineers will gladly make recommendations concerning shaft expansion problems and the use of suitable bearings.

**Table 25: Linear Expansion of Steel Shafting**

Base on Expansion In Inches = 0.000063 x 12 x Length in Feet x Temp. Increase in Degrees Fahrenheit

\* **Recommended Diameters** These shaft diameters are recommended for use whenever possible as various transmission items such as couplings, collars, clutches, pulleys, etc., are carried in stock in these sizes, at least up to 3-15/16", in the principal cities throughout the United States.

**Table 27: Weight and Properties of Round Steel Shafting**

| Shaft Size | Weight per Inch | Section Modulus |         | Moment of Inertia |         | Shaft Size | Weight per Inch | Section Modulus |         | Moment of Inertia |         |
|------------|-----------------|-----------------|---------|-------------------|---------|------------|-----------------|-----------------|---------|-------------------|---------|
|            |                 | Bending         | Torsion | Bending           | Torsion |            |                 | Bending         | Torsion | Bending           | Torsion |

## Viscosity Classification Equivalents

### OIL VISCOSITY EQUIVALENCY CHART

### ISO VISCOSITY CLASSIFICATION SYSTEM

All industrial oils are graded according to the ISO Viscosity Classification System, approved by the International Standards Organizations (ISO). Each ISO viscosity grade number corresponds to the mid-point of viscosity range expressed in centistokes (cSt) at 40°C. For example, a lubricant with an ISO grade of 32 has a viscosity within the range of 28.80-35.2, the midpoint of which is 32.

**Rule-of-Thumb:** The comparable ISO grade of a competitive product whose viscosity in SUS at 100°F is known can be determined by using the following conversion formula:

$$\text{SUS @ 100° F} \div 5 = \text{cSt @ 40°C}$$

## English Standard Measures

### Long Measure

1 mile = 1760 yards = 5280 feet.  
 1 yard = 3 feet = 36 inches.  
 1 foot = 12 inches.

### Surveyor's Measure

1 mile = 8 furlongs = 80 chains.  
 1 furlong = 10 chains = 220 yards.  
 1 chain = 4 rods = 22 yards = 66 feet = 100 links.  
 1 link = 7.92 inches.

### Square Measure

1 square mile = 640 acres = 6400 square chains.  
 1 acre = 10 square chains = 4840 square yards = 43,560 square feet.  
 1 square chain = 16 square rods = 484 square yards = 4356 square feet.  
 1 square rod = 30.25 square yards = 272.25 square feet = 625 square links.  
 1 square yard = 9 square feet.  
 1 square foot = 144 square inches.  
 An acre is equal to a square, the side of which is 208.7 feet.

### Dry Measure

1 bushel (U.S. or Winchester struck bushel) = 1.2445 cubic foot = 2150.42 cubic inches.  
 1 bushel = 4 pecks = 32 quarts = 64 pints.  
 1 peck = 8 quarts = 16 pints.  
 1 quart = 2 pints.  
 1 heaped bushel = 1 1/4 struck bushel.  
 1 cubic foot = 0.8036 struck bushel.  
 1 British Imperial bushel = 8 Imperial gallons = 1.2837 cubic foot = 2218.19 cubic inches.

### Liquid Measure

1 U.S. gallon = 0.1337 cubic foot = 231 cubic inches = 4 quarts = 8 pints.  
 1 quart = 2 pints = 8 gills.  
 1 pint = 4 gills.  
 1 British Imperial gallon = 1.2003 U.S. gallon = 277.27 cubic inches.  
 1 cubic foot = 7.48 U.S. gallons.

### Circular and Angular Measure

60 seconds (") = 1 minute (')  
 60 minutes = 1 degree (-)  
 360 degrees = 1 circumference (C)  
 57.3 degrees = 1 radian  
 2 π radians = 1 circumference (C)

### Specific Gravity

The specific gravity of a substance is its weight as compared with the weight of an equal bulk of pure water.

For making specific gravity determinations the temperature of the water is usually taken at 62° F. when 1 cubic foot of water weighs 62.355 lbs. Water is at its greatest density at 39.20° F. or 4° Centigrade.

### Temperature

The following equation will be found convenient for transforming temperature from one system to another:

Let F = degrees Fahrenheit; C = degrees Centigrade; R = degrees Reamur.

$$F - 32 = \frac{C}{9} = \frac{R}{8}$$

$$180 \quad 100 \quad 80$$

### Avoirdupois or Commercial Weight

1 gross or long ton = 2240 pounds.  
 1 net or short ton = 2000 pounds.  
 1 pound = 16 ounces = 7000 grains.  
 1 ounce = 16 drams = 437.5 grains.

### Measures of Pressure

1 pound per square inch = 144 pounds per square foot = 0.068 atmosphere = 2.042 inches of mercury at 62 degrees F. = 27.7 inches of water at 62 degrees F. = 2.31 feet of water at 62 degrees F.  
 1 atmosphere = 30 inches of mercury at 62 degrees F. = 14.7 pounds per square inch = 2116.3 pounds per square foot = 33.95 feet of water at 62 degrees F.  
 1 foot of water at 62 degrees F. = 62.355 pounds per square foot = 0.433 pound per square inch.  
 1 inch of mercury at 62 degrees F. = 1.132 foot of water = 13.58 inches of water = 0.491 pound per square inch.  
 Column of water 12 in. high, 1 in. dia. = .341 lbs.

### Cubic Measure

1 cubic yard = 27 cubic feet.  
 1 cubic foot = 1728 cubic inches.  
 The following measures are also used for wood and masonry:  
 1 cord of wood = 4 X 4 X 8 feet = 128 cubic feet.  
 1 perch of masonry = 16-1/2 X 1-1/2 X 1 foot = 24-3/4 cubic feet.

### Shipping Measure

For measuring entire internal capacity of a vessel: 1 register ton = 100 cubic feet.  
 For measurement of cargo:  
 1 U.S. shipping ton = 40 cubic feet = 32.143 U.S. bushels = 31.16 Imperial bushels.  
 British shipping ton = 42 cubic feet = 33.75 U.S. bushels = 32.72 Imperial bushels.

### Troy Weight, Used for Weighing Gold and Silver

1 pound = 12 ounces = 5760 grains.  
 1 ounce = 20 pennyweights = 480 grains.  
 1 pennyweight = 24 grains.  
 1 carat (used in weighing diamonds) = 3.086 grains.  
 1 grain Troy = 1 grain avoirdupois = 1 grain apothecaries' weight.

### Measure Used for Diameters and Areas of Electric Wires

1 circular inch = area of circle 1 inch in diameter = 0.7854 square inch.  
 1 circular inch = 1,000,000 circular mils.  
 1 square inch = 1.2732 circular inch = 1,273,239 circular mils.  
 A circular mil is the area of a circle 0.001 inch in diameter.

### Board Measure

One foot board measure is a piece of wood 12 inches square by 1 inch thick, or 144 cubic inches. 1 cubic foot therefore equals 12 feet board measure

**TABLE 29: Decimal and Millimeter Equivalents of Fractions**

| Inches    |      |          | Milli-meters | Inches    |       |          | Milli-meters | Inches    |       |          | Milli-meters |

## Metric System of Measurements

### Measures of Length

|      |                   |                      |
|------|-------------------|----------------------|
| 10   | millimeters (mm.) | = 1 centimeter (cm.) |
| 10   | centimeters       | = 1 decimeter (dm.)  |
| 10   | decimeters        | = 1 meter (m.)       |
| 1000 | meter             | = 1 kilometer (km.)  |

### Measure of Weight

|      |                  |                       |
|------|------------------|-----------------------|
| 10   | milligrams (mg.) | = 1 centigram (cg.)   |
| 10   | centigrams       | = 1 decigram (dg.)    |
| 10   | decigrams        | = 1 gram (g.)         |
| 10   | grams            | = 1 decagram (Dg.)    |
| 10   | decagrams        | = 1 hectogram (Hg.)   |
| 10   | hectograms       | = 1 Kilogram (Kg.)    |
| 1000 | kilograms        | = 1 (metric) ton (T.) |

### Surveyor's Square Measure

|     |                     |                          |
|-----|---------------------|--------------------------|
| 100 | square meters (m.2) | = 1 are (ar.)            |
| 100 | acres               | = 1 hectare (har.)       |
| 100 | hectares            | = 1 sq. kilometer (Km.2) |

### Square Measure

|     |                        |                           |
|-----|------------------------|---------------------------|
| 100 | sq. millimeters (mm.2) | = 1 sq. centimeter (cm.2) |
| 100 | sq. centimeters        | = 1 sq. decimeter (dm.2)  |
| 100 | sq. decimeters         | = 1 sq. meter (m.2)       |

### Cubic Measure

|      |                        |                           |
|------|------------------------|---------------------------|
| 1000 | cu. millimeters (mm.3) | = 1 cu. centimeter (cm.3) |
| 1000 | cu. centimeters        | = 1 cu. decimeter (dm.3)  |
| 1000 | cu. decimeters         | = 1 cu. meter (m.3)       |

### Dry and Liquid Measure

|     |                   |                      |
|-----|-------------------|----------------------|
| 10  | milliliters (ml.) | = 1 centiliter (cl.) |
| 10  | centiliters       | = 1 deciliter (dl.)  |
| 10  | deciliters        | = 1 liter (l.)       |
| 100 | liters            | = 1 hectoliter (Hl.) |

1 liter = 1 cubic decimeter = the volume of 1 kilogram of pure water at a temperature of 39.2 degrees F.

### Length Conversion Constants for Metric and U.S. Units

Millimeters X.039370 = inches.  
Meters x 39.370 = inches.  
Meters X 3.2808 = feet.  
Meters X 1.09361 = yards.  
Kilometers X 3,280.8 = feet.  
Kilometers X.62137 = Statute Miles.  
Kilometers x.53959 = Nautical Miles.

Inches X 25.4001 = millimeters.  
Inches X.0254 = meters.  
Feet x.30480 = meters.  
Yards X.91440 = meters.  
Feet x.0003048 = kilometers.  
Statute Miles X 1.60935 = kilometers.  
Nautical Miles x 1.85325 = kilometers.

### Weight Conversion Constants for Metric and U.S. Units

Grams X 981 = dynes.  
Grams X 15.432 = grains.  
Grams X.03527 = ounces (Avd.).  
Grams x.033818 = fluid ounces (water).  
Kilograms X 35.27 = ounces (Avd.).  
Kilograms X 2.20462 = pounds (Avd.).  
Metric Tons (1000 Kg.) X 1.10231 = Net Ton (2000 lbs.).  
Metric Tons (1000 Kg.) X.98421 = Gross Ton (2240 lbs.).

Dynes X.0010193 = grams.  
Grains X.0648 = grams.  
Ounces (Avd.) X 28.35 = grams.  
Fluid Ounces (Water) X 29.57 = grams.  
Ounces (Avd.) X.02835 = kilograms.  
Pounds (Avd.) X.45359 = kilograms.  
Net Ton (2000 lbs.) X.90719 = Metric Tons (1000 Kg.).  
Gross Ton (2240 lbs.) X 1.01605 = Metric Tons (1000 Kg.).

### Area Conversion Constants for Metric and U.S. Units

Square Millimeters X.00155 = square inches.  
Square centimeters X.155 = square inches.  
Square Meters X 10.76387 = square feet.  
Square Meters X 1.19599 = square yards.  
Hectares X 2.47104 = acres.  
Square Kilometers X 247.104 = acres.  
Square Kilometers X.3861 = square miles.

Square Inches X 645.163 = square millimeters.  
Square Inches x 6.45163 = square centimeters.  
Square Feet x.0929 = square meters.  
Square Yards X.83613 = square meters.  
Acres X.40469 = hectares.  
Acres X.0040469 = square kilometers.  
Square Miles X 2.5899 = square kilometers.

### Volume Conversion Constants for Metric and U.S. Units

Cubic centimeters X.033818 = fluid ounces.  
Cubic centimeters X.061023 = cubic inches.  
Cubic centimeters X.271 = fluid drams.  
Liters X 61.023 = cubic inches.  
Liters X 1.05668 = quarts.  
Liters X .26417 = gallons.  
Liters X.035317 = cubic feet.  
Hectoliters X 26.417 = gallons.  
Hectoliters X 3.5317 = cubic feet.  
Hectoliters X 2.83794 = bushel (2150.42 cu. in.).  
Hectoliters X.1308 = cubic yards.  
Cubic Meters x 264.17 = gallons.  
Cubic Meters x 35.317 = cubic feet.  
Cubic Meters X 1.308 = cubic yards.

Fluid Ounces X 29.57 = cubic centimeters.  
Cubic Inches X 16.387 = cubic centimeters.  
Fluid Drams x 3.69 = cubic centimeters.  
Cubic Inches X.016387 = liters.  
Quarts x.94636 = liters.  
Gallons x 3.78543 = liters.  
Cubic Feet x 28.316 = liters.  
Gallons x.0378543 = hectoliters.  
Cubic Feet x.28316 = hectoliters.  
Bushels (2150.42 cu. in.) X.352379 = hectoliters.  
Cubic Yards x 7.645 = hectoliters.  
Gallons x.00378543 = cubic meters.  
Cubic Feet x.028316 = cubic meters.  
Cubic Yards x.7645 = cubic meters.

### Power and Heat Conversion Constants for Metric and U.S. Units

Calorie x 0.003968 = B.T.U.  
Joules X.7373 = pound-feet.  
Newton-Meters X 8.851 = pound-inches  
Cheval Vapeur X.9863 = Horsepower.  
Kilowatts X 1.34 = Horsepower.  
Kilowatt Hours X 3415 = B.T.U.  
(Degrees Cent. X 1.8) +32 = degrees Fahr.  
(Degrees Reamur X 2.25) + 32 = degrees Fahr.

B.T.U. X 252 = calories.  
Pound-Feet X 1.3563 = joules.  
Pound-inches X.11298 = Newton-meters.  
Horsepower X 1.014 = Cheval Vapeur.  
Horsepower X.746 = kilowatts.  
B.T.U. X.00029282 = kilowatt hours.  
(Degrees Fahr. - 32) x.555 = degrees Cent.  
(Degrees Fahr. - 32) x.444 = degrees Reamur.

## COMMON CONVERSION FACTORS USEFUL IN MECHANICAL POWER TRANSMISSION

### Symbols and Abbreviations Used in Conversion Factors

Symbols and abbreviations found in this section are those currently used in many texts and product publications. Considerable effort is underway to standardize on abbreviations for metric and English units of measurement. Recently, ASTM (American Society for Testing and Materials) and IEEE (Institute of Electrical and Electronic Engineers) published a standard practice on the metric system. † This publication consolidates a great deal of the current thinking and provides a system of abbreviations and symbols that differ somewhat from those used here.

This Handbook has retained use of familiar abbreviations consistent with existing product and trade literature rather than the abbreviations found in current publications of technical and scientific societies.

### Prefixes Used in the Metric System

Common prefixes and symbols used in the metric system are listed below. An example of use is 1000 meters is equivalent to 1 kilometer, and 1/1000 of one meter is equivalent to 1 millimeter.

| Prefix  | Symbol | Multiplication Factor-Decimal and Power of 10                |
|---------|--------|--|
| exa     | E      | 1,000,000,000,000,000,000 or $10^{18}$ or one quintillion    |
| peta    | P      | 1,000,000,000,000,000 or $10^{15}$ or one quadrillion        |
| tera    | T      | 1,000,000,000,000 or $10^{12}$ or one trillion               |
| giga    | G      | 1,000,000,000 or $10^9$ or one billion                       |
| mega    | M      | 1,000,000 or $10^6$ or one million                           |
| kilo    | k      | 1,000 or $10^3$ or one thousand                              |
| *hecto  | h      | 100 or $10^2$ or one hundred                                 |
| *deka   | da     | 10 or $10^1$ or ten  |
| **deci  | d      | 0.1 or $10^{-1}$ or one tenth                                |
| **centi | c      | 0.01 or $10^{-2}$ or one hundredth                           |
| mill    | m      | 0.001 or $10^{-3}$ or one thousandth                         |
| micro   | $\mu$  | 0.000,001 or $10^{-6}$ or one millionth                      |
| nano    | n      | 0.000,000,001 or $10^{-9}$ or one billionth                  |
| pico    | p      | 0.000,000,000,001 or $10^{-12}$ or one trillionth            |
| femto   | f      | 0.000,000,000,000,001 or $10^{-15}$ or one quadrillionth     |
| atto    | a      | 0.000,000,000,000,000,001 or $10^{-18}$ or one quintillionth |

\* Not commonly used.

\*\* Not commonly used except for special situations.  
The centimeter as a unit of length is in common use.  
The decibel is a unit in both electrical and acoustical work.

## Rounding of Numbers

A minimum of four significant figures are used in conversion factors presented here. Where the conversion factor is exact (for example, 1 foot contains 12 inches), decimal fractions are not necessary. Also, where large whole numbers are used (for example, 1 square kilometer contains 1195990 square yards), decimal fractions are not used unless justified by the accuracy of ordinary computations.

|         |                          |
|---------|--------------------------|
| 1195990 | (sq yd in a sq km)       |
| 4389.12 | (cc in a cu ft)          |
| 448.86  | (gpm in a liter per sec) |
| 14.70   | (psi in an atmosphere)   |
| 0.4331  | (psi in a ft of water)   |
| 0.0625  | (lb-in in an oz-in)      |

### POWER

|                       |   |        |
|-----------------------|---|--------|
| horsepower (hp) ..... | kilowatts (kW) .....                          | 0.7457 |
|                       | foot-pounds per second (ft-lb per sec) .....  | 550    |
|                       | foot-pounds per minute (ft-lb per min.) ..... | 33000  |
| kilowatts (kW) .....  | horsepower (hp) .....                         | 1.341  |

### TEMPERATURE

|                              |                              | Use This Relationship |
|------------------------------|------------------------------|-----------------------|
| degrees Fahrenheit (F) ..... | degrees Celsius (C) .....    | $C = 5/9 (F - 32)$    |
| degrees Celsius (C) .....    | degrees Fahrenheit (F) ..... | $F = 9/5C + 32$       |
| degrees Fahrenheit (F) ..... | degrees Rankine (R) .....    | $R = F + 459.69$      |
| degrees Celsius (C) .....    | degrees Kelvin (K) .....     | $K = C + 273.16$      |

- Examples:**
- Convert 12F to C.  $C = 5/9 (F - 32) = 5/9 (12 - 32) = 5/9 (-20)$   
Answer = -11.1C
  - Convert 40C to F.  $F = 9/5C + 32 = 9/5 (40) + 32 = 72 + 32$   
Answer = 104F

## GRAVITATIONAL CONSTANT

g = 32.174 feet per second per second (ft per sec<sup>2</sup>)  
 = 9.8067 meters per second per second (m per sec<sup>2</sup>)

### Formulas and Constants

1 HP = 33,000 Foot-pounds of work per minute.

1 HP = .746 K.W. = K.W.P 1.341.

1 HP = 2547 B.T.U. per hour.

1 B.T.U. = Heat required to raise 1 lb. water 1-F.

1 B.T.U. = 777.6 Foot-pounds work.

1 Kilowatt Hour = 3415 B.T.U.

Heat Value of Carbon = 14,600 B.T.U. per pound.

Latent Heat of Fusion of Ice = 143.15 B.T.U. per pound.

Latent Heat of Evaporation of Water at 212° F. = 970.4 B.T.U. per pound.

Total Heat of Saturated Steam at atmospheric pressure = 1,150.4 B.T.U. per pound.

1 Ton of Refrigeration = 288,000 B.T.U. per 24 hours.

g = Acceleration of Gravity (commonly taken as 32.16 feet per second per second).

1 Radian = 57.296 degrees.

1 Meter = 100 cm. = 39.37 inches.

1 Kilometer = .62137 miles.

1 Gallon = 231 cubic inches.

1 Barrel = 31.5 gallons.

Atmospheric Pressure = 14.7 pounds per sq. in.

= 29.92 inches mercury at 32° F.

1 Lb. per Sq. In. Pressure = 2.3095 feet fresh water at 62° F.

= 2.0355 inches mercury at 32° F.

= 2.0416 inches mercury at 62° F.

Water Pressure (pounds per sq. in.) = .433 X height of water in feet (Fresh water at 62°F).

Weight of 1 cu. ft. fresh Water = 62.355 lbs. at 62°F.

= 59.76 lbs. at 212° F.

Weight of 1 cu. ft. Air at 14.7 lbs. per sq. in. Pressure = .07608 lbs. at 62° F.

= .08073 lbs. at 32° F.

† Also look in the General Index under Weights, Measures, or the subject material required.

## Flywheel Formulas

**Flywheels** are used on some machines, for example air compressors, to even out load pulsations. The following formulas are useful in designing entire flywheels and flywheel rims. A V-belt sheave may also be used as a flywheel eliminating the need for a separate flywheel in the system.

### Formulas for Entire Flywheel

Kinetic energy of rotation of a flywheel (foot pounds)  
 $= .0001705 N^2(WR^2)^*$ .

Torque to uniformly accelerate or decelerate a flywheel

$$= \frac{.03908 (N_2 - N_1) (WR^2), * \text{ pound-inches}}{t}$$

where  $N_2$  = final R.P.M. and  $N_1$  = initial R.P.M.  
 Velocity at outside diameter (feet per minute) =  $0.2618 ND$ .

W = weight (pounds).

R = radius of gyration (feet).

N = speed (R.P.M.)

t = time to change from  $N_1$  to  $N_2$  (seconds).

F = face of rim (inches).

D = outside diameter of rim (inches).

d = inside diameter of rim (inches).

K = weight per cubic inch of material (pounds).

\* $WR^2$  = flywheel effect (pounds X feet<sup>2</sup>). See table to the right for  $WR^2$  of rims. Ordinarily the  $WR^2$  of the rim only is considered.

In unusual instances the relatively small  $WR^2$  values of the hub and arms or web can be added directly to the  $WR^2$  of the rim if desired. To find the  $WR^2$  of a hub or web use the  $WR^2$  formula for rims, substituting the hub or web outside diameter, inside diameter, and width for D, d and F respectively. When arms are used instead of a web an approximate  $WR^2$  value of the arms is the total weight of the arms in pounds times the square of the radius in feet from the shaft center line to the mid point of the arms between hub and rim.

**Table 31: Formulas for Flywheel Rims**

| Property   | Cast Iron Rim<br>(Based on .26 lbs.<br>per cu. in.) | Steel<br>Rim<br>(Based on .283 lbs.<br>per cu. in.) | Rim of any<br>material<br>weighing<br>K pounds per<br>cubic inch |
|--|---|---|--|
| Volume<br>(Cubic<br>Inches)  | .7854F(D <sup>2</sup> -d <sup>2</sup> )             | .7854F(D <sup>2</sup> -d <sup>2</sup> )             | .7854F(D <sup>2</sup> -d <sup>2</sup> )                          |
| W<br>Weight<br>(Pounds)  | .2042F(D <sup>2</sup> -d <sup>2</sup> )             | .2223F(D <sup>2</sup> -d <sup>2</sup> )             | .7854FK(D <sup>2</sup> -d <sup>2</sup> )                         |
| R<br>Radius of<br>Gyration<br>(Feet)   | $\sqrt{\frac{.8681 (D^2-d^2)}{1000}}$               | $\sqrt{\frac{.8681 (D^2-d^2)}{1000}}$               | $\sqrt{\frac{.8681 (D^2-d^2)}{1000}}$                            |
| $WR^2$<br>Wt X Sq.<br>of Radius of<br>Gyration<br>(Lbs. X Ft. <sup>2</sup> ) | $\frac{.1773F(D^4-d^4)}{1000}$                      | $\frac{.1929F(D^4-d^4)}{1000}$                      | $\frac{.6818FK(D^4-d^4)}{1000}$                                  |
| T ▲<br>Tensile Load<br>in rim (Lbs.)   | $\frac{.3078FN2(D^3-d^3)}{1000000}$                 | $\frac{.3350FN2(D^3-d^3)}{1000000}$                 | $\frac{1.184FKN2(D^3-d^3)}{1000000}$                             |

▲ Centrifugal force causes this tensile load at each and every section of the rim. Hence, on rims split into two or more sections the fastening at each joint should be designed to take the full load as calculated from the formula here given.

### Centrifugal Force

R = Distance from the axis of rotation to the center of gravity of the body (feet).

N = Revolutions per minute.

v = Velocity of the center of gravity of the body (feet per second).

g = Acceleration due to gravity (32.16 commonly).

$$F = \frac{Wv^2}{gR} = \frac{WRN^2}{2933} = .000341 WRN^2$$

F = Centrifugal force tending to move the body outward from the axis of rotation (pounds).

W = Weight of body (pounds).

# ENGINEERING

## Torque and Horsepower Equivalents

A foot-pound is the amount of energy expended in lifting a one-pound mass a distance of one foot against the pull of gravity

### FOOT-POUNDS INDICATE ENERGY

| TORQUE   |
|--|
| It is: a turning moment or twisting effort. Is it expressed in foot-pounds? or pound-feet? |
| ↔  |

A pound-foot is the moment created by a force of one pound applied to the end of a lever arm one

### POUND-FEET INDICATE TORQUE

$$\begin{aligned} \text{Torque (in Pound-Inches)} &= \frac{63025 \times \text{HP}}{\text{RPM}} \\ &= \text{Force} \times \text{Lever Arm (In Inches)} \\ \text{Torque (in Pound-Feet)} &= \frac{5252 \times \text{HP}}{\text{RPM}} \\ &= \text{Force} \times \text{Lever Arm (In Feet)} \end{aligned}$$

- Force = Working Load in Pounds.
- FPM = Feet Per Minute.
- RPM = Revolutions Per Minute.
- Lever Arm = Distance from the Force to the center of rotation in Inches or Feet.

### Example:

$$\begin{aligned} 25 \text{ HP at } 150 \text{ RPM} &= 10504 \text{ Pound-Inches Torque} \\ 2.5 \text{ HP at } 150 \text{ RPM} &= 1050.4 \text{ Pound-Inches Torque} \end{aligned}$$

For other values of RPM move decimal point in RPM values to the left or right as desired, and in Torque values move to the right or left (opposite way) the same number of places.

### Example:

$$\begin{aligned} 25 \text{ HP at } 150 \text{ RPM} &= 10504 \text{ Pound-Inches Torque} \\ 25 \text{ HP at } 1.50 \text{ RPM} &= 1050400 \text{ Pound-Inches Torque} \\ 2.5 \text{ HP at } 1.50 \text{ RPM} &= 105040 \text{ Pound-Inches Torque} \end{aligned}$$

| HORSEPOWER   |
|--|
| <b>Common Unit of Mechanical power - (HP)</b>  |
| <b>One HP is the rate of work required to raise 33,000 pounds one foot in one minute</b> |

$$\begin{aligned} \text{HP} &= \frac{\text{Force} \times \text{FPM}}{33,000} \\ \text{HP} &= \frac{\text{Torque (in Pounds-Inches)} \times \text{RPM}}{63,025} \\ \text{HP} &= \frac{\text{Torque (in Pounds-Feet)} \times \text{RPM}}{5,252} \end{aligned}$$

## Overhung Loads

An overhung load is a bending force imposed on a shaft due to the torque transmitted by V-drives, chain drives and other power transmission devices, other than flexible couplings.

Most motor and reducer manufacturers list the maximum values allowable for overhung loads. It is desirable that these figures be compared with the load actually imposed by the connected drive.

Overhung loads may be calculated as follows:

$$\text{O.H.L.} = \frac{63,000 \times \text{HP} \times \text{F}}{\text{N} \times \text{R}}$$

- Where HP = Transmitted hp X service factor
- N = RPM of shaft
- R = Radius of sprocket, pulley, etc. (inches)
- F = Factor (See chart to right)

Weights of the drive components are usually negligible. The formula is based on the assumption that the load is applied at a point equal to one shaft diameter from the bearing face. Factor F depends on the type of drive used:

$$F = \begin{cases} 1.00 & \text{for single chain drives.} \\ 1.3 & \text{for TIMING Belt Drives and Sync belt Drives.} \\ 1.25 & \text{for spur or helical gear or double chain drives.} \\ 1.50 & \text{for V-belt drives.} \\ 2.50 & \text{for flat belt drives.} \end{cases}$$

**Example:** Find the overhung load imposed on a reducer by a double chain drive transmitting 7 hp @ 30 RPM. The pitch diameter of the sprocket is 10"; service factor is 1.3.

**Solution:** 
$$\text{O.H.L.} = \frac{(63,000) (7 \times 1.3) (1.25)}{(30) (5)} = 4,780 \text{ lbs.}$$

## Mathematical Equations

- To find circumference of a circle, multiply diameter by 3.1416.
- To find diameter of a circle, multiply circumference by .31831.
- To find area of a circle, multiply square of diameter by .7854.
- To find area of a rectangle, multiply length by breadth.
- To find area of a triangle, multiply base by 1/2 perpendicular height.
- To find area of ellipse, multiply product of both diameters by .7854.
- To find area of parallelogram, multiply base by altitude.
- To find side of an inscribed square, multiply diameter by 0.7071 or multiply circumference by 0.2251 or divide circumference by 4.4428.

- To find side of inscribed cube, multiply radius of sphere by 1.1547.
- To find side of an equal square, multiply diameter by .8862.
- To find the surface of a sphere, square the diameter and multiply by 3.1416.
- To find the volume of a sphere, cube the diameter and multiply by .5236.
- A side of a square multiplied by 1.4142 equals diameter of its circumscribing circle.
- A side of a square multiplied by 4.443 equals circumference of its circumscribing circle.

**Table 33: Properties of Sections**

$A$  = area  
 $I$  = moment of inertia  
 $J$  = polar moment of inertia

$Z$  = section modulus  $\pi$   
 $k$  = radius of gyration  
 $y$  = centroidal distance

### Rectangle

$$A = bh$$

$$k = 0.289h$$

$$I = \frac{bh^3}{12}$$

$$\bar{y} = \frac{h}{2}$$

$$Z = \frac{bh^2}{6}$$

### Triangle

$$A = \frac{bh}{2}$$

$$k = 0.236h$$

$$I = \frac{bh^3}{36}$$

$$\bar{y} = \frac{h}{3}$$

$$Z = \frac{bh^2}{24}$$

### Circle

$$A = \frac{\pi d^2}{4}$$

$$J = \frac{\pi d^4}{32}$$

$$I = \frac{\pi d^4}{64}$$

$$k = \frac{d}{4}$$

$$Z = \frac{\pi d^3}{32}$$

$$\bar{y} = \frac{d}{2}$$

### Hollow Circle

$$A = \frac{\pi}{4} (d^2 - d_i^2)$$

$$J = \frac{\pi}{32} (d^4 - d_i^4)$$

$$I = \frac{\pi}{64} (d^4 - d_i^4)$$

$$k = \sqrt{\frac{d^2 - d_i^2}{16}}$$

$$Z = \frac{\pi}{32d} (d^4 - d_i^4)$$

$$\bar{y} = \frac{d}{2}$$
