Shaded areas indicate rim speeds exceeding 6500 FPM which may require higher strength sheaves.

TOTAL RATING = rated HP + "additional HP" from right hand column.

‡ Additional HP below 1.02 ratio equals zero.

$\Delta$  Subject to Arc and Length Corrections Factors on page PT7-47.

Shaded areas indicate rim speeds exceeding 6500 FPM which may require higher strength sheaves.

TOTAL RATING = rated HP + "additional HP" from right hand column.

‡ Additional HP below 1.02 ratio equals zero.

Δ Subject to Arc and Length Corrections Factors on page PT7-47.

NOTE: Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

Shaded areas indicate rim speeds exceeding 6500 FPM which may require higher strength sheaves.

TOTAL RATING = rated HP + "additional HP" from right hand column.

‡ Additional HP below 1.02 ratio equals zero.

Shaded areas indicate rim speeds exceeding 6500 FPM which may require higher strength sheaves.

TOTAL RATING = rated HP + "additional HP" from right hand column.

‡ Additional HP below 1.02 ratio equals zero.

Shaded areas indicate rim speeds exceeding 6500 FPM which may require higher strength sheaves.

TOTAL RATING = rated HP + "additional HP" from right hand column.

$\ddagger$  Additional HP below 1.02 ratio equals zero.

$\Delta$  Subject to Arc and Length Corrections Factors on page PT7-47.

**CAUTION: Belt horsepower ratings may exceed design capacity of stock sheaves. Consult factory for recommendations.**

NOTE: Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

## SELECTION

### Stock Classical Drives: Standard Motor Speeds

**Step 1 - Determine Service Factor.** Refer to Typical Service factors, Table 7. Locate type of Driven and Driver equipment. (If an idler is used, increase the factor by value indicated). Correct factor is determined by: 1. The extent and frequency of peak loads. 2. Number of operating hours/year, broken down in average hours/day of continuous service. 3. Proper service category: (Intermittent, Normal or Continuous). Select the one closest to the application conditions.

**Step 2 - Compute Design HP.** Multiply normal running HP required or nameplate rating by service factor obtained in Step 1.

**Step 3 - Choose Belt Section.** Using Table 6, below, read up from design HP figure obtained in Step 2 and over from the RPM of faster shaft. This intersection indicates belt sections.

**Step 4 - Select the Drive.** a) Using belt section from Step 3, refer to Stock Drive Selection Tables beginning on page PT7-90. b) Under appropriate driver speed column find Driven RPM nearest to the desired speed. To the right note HP per Belt. Read left for Driver/Driven Sheave information. (If driver is an electric motor be sure motor sheave diameter is not less than shown in Table 8.) c) Read onto opposite page and find figure nearest the required center distance. Note Arc-Length Correction Factor in the shaded row below the C.D. figure. d) Read to the top of the table for the belt size. e) **To determine number of belts**, multiply the HP per Belt value by the Arc Length Correction Factor. This is the corrected HP/ belt. Divide design HP by corrected HP figure to determine number of belts required.

#### EXAMPLE OF SELECTION

Select a classical drive for a continuous duty 3-piston compressor, with a 2-7/16, shaft, to run at about 284 RPM, driven by a 30 HP, 1160 RPM squirrel cage electric motor with a 2-1/8, shaft. Desired center distance is approximately 36".

**Step 1** - Service factor from Table 7 is 1.4.

**Step 2** - Design HP = 1.4 x 30 = 42 HP.

**Step 3** - A C-section belt is shown in Table 11 when reading to the right of 1160 RPM and up from 42 design HP.

**Step 4** - Turn to C-Stock Drive Selection Tables beginning on page PT7-124. Under 1160 RPM Driven, read down to find 285 RPM. One selection is 284 on page PT7-128. Note HP/belt as 15.47 for all SL Classic belts and Polyband belts over 116" and 19.34 for all Classic-Cog and Polyband under 116". Also note sheaves listed as a 8.5 Driver, 36.0 Driven. Table 8 shows driver is not undersize. Reading to opposite page the C.D. figure of 35.9 is closest to 36". Top of table shows belt size as C144.

The HP/belt for SL Classic is 15.47. This value x the .95 factor = 14.7 corrected HP/belt. 42 HP ÷ 14.7 = 2.85. Going to the next whole number the drive requires 3 SL Classic belts. (Center to center operating distance is 35.9 nominal.) **Order:** 1. 3 - C144 SL Classic Belts. 2. 1 - 3-groove C8.5 TAPER-LOCK Sheave. 3. 1 - 2-1/8, bore 2517 bushing. 4. 1 - 3-groove C36.0 TAPER-LOCK Sheave. 5. 1 - 2-7/16, bore 3535 bushing.

(The steps above may be used to figure a Classic-COG drive with higher HP ratings. This drive usually uses fewer grooves and will be more compact. The decision to use SL Classic, Classic-COG or POLYBAND belts involves economics, interchangeability, etc.).

**Table 6 - Narrow Cross Section Selection Chart**

**NOTE:** Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

**NOTE:** Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

# SELECTION

## Stock Classical Drives: Non Standard Motor Speeds & Speed-Up Drives

For Speeds Other Than Standard Motor Speeds:

**Step 1 - Determine Speed Ratio** =  $\left( \frac{\text{Driver RPM}}{\text{Driven RPM}} \right)$

**Step 2 - Compute Design HP.** Multiply normal running HP required or nameplate rating by service factor from Table 2.

**Step 3 - Determine Maximum Diameter** of Driver Sheave

@ 6500 FPM: O.D. =  $\left( \frac{6500 \text{ RPM}}{.262 \times \text{RPM}} \right)$

**Step 4 - Select Belt Cross Section.** Using Table 6, read up from design HP figure obtained in Step 2 and over from the RPM of faster shaft. This intersection indicates belt section.

**Step 5 - Select Drive.** Using the belt section from Step 4, make a tentative sheave selection from **Stock Drive Selection Tables**. (Note that several choices are available in the ratio obtained from Step 1.) Other choices close to this ratio may also produce a functional drive. Read onto opposite page and find figure nearest the required center distance. The Arc-Length Correction Factor is listed in the shaded row below the C.D. figure. Read to the top of the table for the belt size.

**Step 6 - Size the Drive.** From Basic HP Tables beginning on page PT7-118, locate HP rating at intersection of RPM row and small sheave column. To this, add the "additional HP" figure based on drive ratio. This becomes the rated HP. Multiply this sum by the arc-length correction factor noted in Step 5. This becomes the corrected HP per belt. To find

Required number of belts :  $\frac{\text{Design HP}}{\text{Correction HP/Belt}}$

### EXAMPLE OF SELECTION

A V-drive is needed for a 15 HP, 2200 RPM gasoline engine, with a 1-5/8" shaft, running a reducer on a belt conveyor. 2-5/16" reducer input shaft shaft runs at 1490 RPM. Service is intermittent. Center distance is 36".

**Step 1 - Speed Ratio** =  $\frac{2200}{1785} = 1.48$

**Step 2 - Service Factor** = 1.2 Design HP = 15 x 1.1 = 16.5

**Step 3 - Driver Sheave Max. Dia.** =  $\frac{6500}{.262 \times 2200} = 11.3$

**Step 4 - Belt Cross Section** = Table 11 indicates A-AX.

**Step 5** - Turn to A, AX **Stock Drive Selection Tables** beginning on page PT7-106. Find the 1.48 ratio obtained in the Step 1 calculations. The most economical drive shows a 4.6 Driver,

**NOTE:** Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

7.0 Driven Sheave. The C.D. nearest 36" is 36.5. The correction factor below the C.D. figure is 1.07. Top of the table shows an A90 belt. Refer to Basic HP Tables on page PT7-134. From the 2200 RPM of the faster shaft row and down from the 4.6 smaller sheave:

5.80 HP/belt plus an additional HP of .44 in the 1.35 thru 1.99 ratio column. The sum = 6.24 HP/belt x 1.07 arc-length correction factor = 6.68 HP/belt.

Number of belts =  $\frac{16.5}{6.68} = 2.47$  or 3 belts

**Order:** 1- 3 groove A4.6 TAPER-LOCK Sheave, 1 to 1-5/8" bore 1610 bushing, 1-3 groove A7.0 sheave, 1 to 2-5/16" bore 2517 bushing, 3-A90 SL Classic Belts.

### Example of an "A" Speed-Up Drive

A 10 HP 1750 RPM AC motor, with a 1-3/8" shaft is to drive a high speed blower @ 4000 RPM. The blower shaft is 1-7/16", center distance 24" and equipment runs 24 hrs./day.

1. Service Factor from Table 12 is 1.2.
2. Design HP = 10 x 1.2 = 12 HP.
3. Speed Ratio =  $\frac{4000}{1750} = 2.29$
4. In Stock Drive Table, under 2.29 ratio, sheaves are listed as 3.4 Driver/8.2 Driven. (In a speed-up drive, the 3.4 sheave becomes the Driven, the 8.2 the Driver.) The opposite page of the table shows the closest center distance as 24.4 with an arc length correction factor of .96. Belt shown at top of table is A66.
5. From **Basic Horsepower Tables** a 3.4 sheave @ 4000 RPM = (4.38 + 1.00) = 5.38.  
5.38 x .96 = 5.16 corrected HP/belt.
6. **Number of Belts** =  $\frac{\text{Design HP}}{\text{Corrected HP}} = \frac{12}{5.16} = 2.33$   
or 3 belts.
7. **Order:** 1-3 groove A8.2 TAPER-LOCK Sheave, 1 to 1-3/8" bore 2517 bushing, 1-3 groove A3.4 TAPER-LOCK Sheave, 1 to 1-7/16" bore 1610 bushing, 3-A66 SL belts.

**NOTE:** To determine required belt length when center distance and sheave datum diameters are known, use the following formula.

$$L = 2C + 1.57(D + d) + \frac{(D - d)^2}{4c}$$

L = Belt Length In Inches

C = Center Distance

D = Datum Dia. of Large Sheave

d = Datum Dia. of Small Sheave

# SELECTION

## Belt Correction Factors

Table 9 - Classical Belt Length Correction Factors

| Datum Length   | Factor | Datum Length           | Factor | Datum Length           | Factor | Datum Length           | Factor | Datum Length           | Factor | Datum Length           | Factor | Datum Length           | Factor |
|----------------|--------|------------------------|--------|------------------------|--------|------------------------|--------|------------------------|--------|------------------------|--------|------------------------|--------|

Shaded areas indicate rim speed exceeding 6500 FPM which may require special sheaves

## IDLER

### Brackets and Bushings

- Double Adjustable Bracket for Maximum Flexibility
- Positive Ratchet Locking Between Base and Arm
- Idler Bushings in TAPER-LOCK and QD Style
- Use with Stock Products, such as: Sheaves, Roller Chain Sprockets, HTD Sprockets
- Compatible with Products Machined for:  
TAPER-LOCK 1610, 2012 and 2517 Bushings QD SK, SF and E Bushings
- Also, NEMA - Motor Bases Shaft Collars

Refer to Related Products (page PT12-40) for complete data.

## Computer Drive Selection Program

For any given set of drive conditions, there are many different drives that will satisfy the requirements. What is a “best drive”? It could be the drive with lowest initial cost, or the drive with the lowest bearing load, or the drive which minimizes the number of parts required.

Finding the best drive is a time-consuming and frustrating task for the design engineer. Manual drive selection, pricing, and organizing of data for analysis can be a long, drawn-out process, prone to errors and oversights. VIA-VISA Software handles such problems with ease and displays drive selection alternatives in an organized format that makes analysis a simple process.

Here's what you get with VIA-VISA Software selection:

- Belt size, type, quantity, part number.
- Sheave sizes, part number.
- Bushing type, part number.
- Drive face width.
- Actual center distance.
- Installation force/deflection values for drive tensioning.
- Belt pull, dynamic shaft load for bearing and shafting calculations.
- Net price (if discount multipliers entered). Default to total list price.
- Belt speed in feet per minute.
- Calculated driven RPM
- Calculated actual service factor.

Ask your DODGE Sales Engineer for a demonstration and instruction on how you can obtain your personal VIA-VISA package.

### V-Drive Accessories

#### V-Belt Measuring Gage

This gage allows you to measure belts that may have lost their identification. This is easily done by slipping belt in “sheave” grooves and moving bottom sheave until belts is taut. Notched portion of bottom sheave indicates belt width. Belt length is then read opposite corresponding width on scale. Gage is made of aluminum and plastic – rust proof and durable.

**Part No. 450966**  
Wt - 1 Lb.

#### V-Belt Groove and Belt Gage

When V-belt sections or sheave groove need to be identified this set of molded plastic gages can be the handiest thing in your tool box. Includes 8 gages for grooves and 2 for belts covering Classical A thru E, A/B Combination grooves and Narrow 3V, 5V and 8V. They are pinned together so that the individual gages will not become lost.

**Part No. 121294**  
Wt. - 0.12 Lb.

**NOTE:** Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

### V-Drive Accessories

#### V-Belt Tension Tester

This convenient tool facilitates easy checking of belt tension on drives having two or more belts. Scales are provided for reading both the required force and the distance of belt deflection which are used in properly tensioning belts. Force range is 0 - 35 lbs.

**Part No. 109082**  
Wt. - 0.5 Lb.

#### Precision Laser Alignment Device

Identifies common types of pulley misalignment.

**Part No. 109993**  
Wt. - 30 Lb

#### Double Barrel Tension Tester

Maximum deflection force: 66 lbs. For use with all multiple V-belts and large synchronous belts.

**Part No. 109991**  
Wt. - 0.5 Lb

#### Five Barrel Tension Tester

Maximum deflection force: 165 lbs. For use with multiple V-belts and large synchronous belts.

**Part No. 109992**  
Wt. - 1 Lb.

#### Sonic Tension Meter - Model 507C

The Sonic Tension Meter is an electronic device that measures the natural frequency of a free stationary belt span and instantly computes the static belt tensions based upon the belt span length, belt width, and belt type. The Sonic Tension Meter can accurately measure belt tensions for both synchronous and v-belts. Other features include:

- Output readings can be switched between pounds, kilograms, newtons and hertz
- Auto gain control automatically adjusts meter sensitivity
- Auto frequency range filters for background noise
- Frequency range from 10 - 5,000 Hz

Sonic Tension Meter - Model 507C  
(Comes with meter) **Part No. 109994** Wt. - 1.0 Lb.

★ Flexible Sensor **Part No. 109995** Wt. - 0.2 Lb.

Cord Sensor **Part No. 109996** Wt. - 0.2 Lb.

★ Inductive Sensor (magnets included) **Part No. 109997** Wt. - 0.2 Lb.

★ Optional accessories

**NOTE: Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).**

## INSTALLING/TENSIONING V-DRIVES INSTALLING A DRIVE

**Check Condition of Sheaves**—Before a new set of V-belts are installed, check the condition of the sheaves. Dirty or rusty sheaves impair the drive’s efficiency and abrade the belts, which result in premature failure.

Worn sheaves shorten belt life as much as 50%. If the grooves are worn to where the belt bottoms, slippage may result and burn the belts. If the sidewalls are “dished out,” the bottom shoulder ruins the belts prematurely by wearing off the bottom corners.

**Check Sheave Alignment**—Sheave adjustment should be checked by placing a straight edge or tight cord across the sheave faces so that it touches all four points of contact. Ordinarily, a misalignment of more than one-half of one degree (one-eighth inch in one foot) will adversely affect belt life. Improper sheave alignment produces uneven wear on one side of the belt, causes the belt to roll over in the sheaves or throws all the load on one side of the belt, stretching or breaking the cords on that side.

### INSTALLATION AND TAKE-UP ALLOWANCES

After calculating a center distance from a standard pitch length,

make provision for adjusting the center distance as in sketch below, to allow for installation of the belts without injury, for tensioning, and for maintenance of proper tension throughout the life of the belt. (Refer to Tables 11 or 12 for values).

**Placing Belts on Sheaves**—Shorten the center distance of the drive until the belts can be put on the sheaves without forcing. Forcing the belts can cause internal injury to the belts.

**Belt Selection**—For maximum service, replace V-belt drives with a complete new matched set of belts or use the new Matchmaker belts.

Never employ a used belt as a replacement for a unit of a set. Used belts, normally, are worn in cross-section and stretched. A new belt so applied will ride higher in the sheave, travel faster and operate at a much higher tension than the used belts. The cord center may be ruptured, allowing the new belt to elongate. Shortly after this occurs it will cease to accept its full share of the load, leaving the drive under-belted. Thus, the new belt is wasted. Belts of different manufacturers should not be mixed for the same reasons.

**Table 11 - Center Distance Allowance for Narrow Belt Installation and Take-Up**

| Nom. Belt Lgth. in Inches | Min. Installation Allowance (in inches) (Below Center) |              |           |              |           |              | Min. Take-up Allowance (Above Center) |

### TENSIONING A DRIVE

#### General Rules of Tensioning-

1. Ideal tension is the lowest tension at which the belt will not slip under peak load conditions.
2. Check tension frequently during the first 24-48 hours of run-in operation.
3. Over tensioning shortens belt and bearing life.
4. Keep belts free from foreign material which may cause slip.
5. Make V-Drive inspection on a periodic basis. Tension when slipping. Never apply belt dressing as this will damage the belt and cause early failure.

#### SIMPLE TENSIONING PROCEDURE

1. Measure the span length, K.
2. At the center of the span (K) apply a force (perpendicular to the span) large enough to deflect the 1/64, for every inch of span length. For example, one deflection of a 100 inch span would be 100/64 or 1-9/16 inches.

3. Compare the force you have applied with the values given in Tables 13 or 14. If the force is between the values for normal tension, and 1-1/2 times normal tension, the drive tension should be satisfactory. A force below the value for normal tension indicates an under-tensioned drive. If the force exceeds the value for 1-1/2 times normal tension, the drive is tighter than it needs to be.

**For V-Belt Tension Testers, See Page PT7-142.**

After the proper operating tension has been applied to the belts, a double-check should be made of the following:

- a. Parallel position of the sheave shafts.
- b. Correct alignment of sheave grooves.

**NOTE:** Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

## INSTALLING/TENSIONING V-DRIVES

**Table 13 - Belt Deflection Force (Check Factory For Conditions Not Covered In This Table)**

| V-Belt Section          | Small Sheave |          | Deflection Force In Lbs. For Drive Speed Ratio of: |      |      |       |

**Notes:** 1. Use approximately 130% of above values to tension a new set of belts  
 2. Use closest sheave diameter for sizes not shown.

**NOTE:** Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

# TECHNICAL

## INSTALLING/TENSIONING V-DRIVES

**Table 14 - POLYBAND Plus Belt Deflection Force (Lbs.)**  
(Force is pounds for one belt only)

| Cross Section | Small Sheave Diameter Range | RPM Range | Belt Deflection Force* |          |
|---------------|-----------------------------|-----------|------------------------|----------|
|               |                             |           | Normal                 | New Belt |
| 5VF           | 7.1-10.9                    | 200-700   | 21.1                   | 30.9     |
|               |                             | 701-1250  | 18.0                   | 26.3     |
|               |                             | 1251-1900 | 16.7                   | 23.4     |
|               |                             | 1901-3000 | 15.8                   | 23.0     |
| 5VF           | 11.8-16.0                   | 200-700   | 26.8                   | 39.5     |
|               |                             | 701-1250  | 23.5                   | 34.7     |
|               |                             | 1251-2100 | 22.7                   | 33.3     |
| 8VF           | 12.5-20.0                   | 200-500   | 44.7                   | 65.8     |
|               |                             | 501-850   | 38.5                   | 56.6     |
|               |                             | 851-1150  | 35.2                   | 51.6     |
| 8VF           | 21.2-25.0                   | 1151-1650 | 33.5                   | 49.0     |
|               |                             | 200-500   | 65.9                   | 97.6     |
|               |                             | 501-850   | 61.2                   | 90.6     |
|               |                             | 851-1200  | 57.0                   | 84.3     |

\* Multiply the force required for one belt by the number of belts in the Polyband Plus unit to get total force to apply.  
 Example: New 8VF drive with a small sheave dia. equal to 20".  
 The rpm of the sheave is 1000.  
 The belt to be installed is 8/8VF4000.  
 Total deflection force = table value x 8 = 51.6 x 8 = 413 lbs.

### Belt Pull and Bearing Loads

**Belt Pull Calculations**—The following method of calculating belt pull is found to be the most convenient and accurate for drives operating at design loads and tensions:

$$T1 + T2 = 33,000 (2.5-G) \left( \frac{HP}{GV} \right)$$

WHERE:

T1 = Tight side tension, pounds

T2 = Slack side tension, pounds

HP = Design horsepower

V = Belt speed, feet per minute = (PD) (RPM) (.262)

G = Arc of contact correction factor

| D-d | Arc of Contact | Factor G | D-d  | Arc of Contact | Factor G |
|-----|----------------|----------|------|----------------|----------|
| C   |                |          | C    |                |          |
| .00 | 180°           | 1.00     | .80  | 133°           | .87      |
| .10 | 174°           | .99      | .90  | 127°           | .85      |
| .20 | 169°           | .97      | 1.00 | 120°           | .82      |
| .30 | 163°           | .96      | 1.10 | 113°           | .80      |
| .40 | 157°           | .94      | 1.20 | 106°           | .77      |
| .50 | 151°           | .93      | 1.30 | 99°            | .73      |
| .60 | 145°           | .91      | 1.40 | 91°            | .70      |
| .70 | 139°           | .89      | 1.50 | 83°            | .65      |

Arc of contact is on small sheave

D = Diam. of large sheave

d = Dia. of small sheave

C = Center distance

NOTE: Selection program VIA-VISA available at [www.ptwizard.com](http://www.ptwizard.com).

# V-Belt Sheave Groove Dimensions

## Narrow

# ENGINEERING/TECHNICAL

## More Power and Life From V-Drives

| Trouble Area And Observation  | Cause   | Remedy   |
|---|---|--|
| <p><b>Belt Stretch Beyond Take-Up</b><br/>Belt stretch unequally.</p> <p>All belts stretch about equally.</p>   | <p>Mis-aligned drive, unequal work done by belts.</p> <p>Belt tensile member broken from improper installation. Insufficient take-up allowance.</p> <p>Greatly overloaded or underdesigned drive.</p>   | <p>Realign and re-tension drive.</p> <p>Replace all belts with new matched set properly installed.<br/>Check take-up and follow allowance on page .</p> <p>Redesign.</p>   |
| <p><b>Short Belt Life</b><br/>Relatively rapid failure; no visible reason.</p> <p>Sidewalls soft and sticky. Low adhesion between cover plies. Cross-section swollen.</p> <p>Sidewalls dry and hard. Low adhesion between cover plies. Bottom belt cracked.</p> | <p>Tensile members damaged through improper installation. Worn sheave grooves (check with groove gauge)</p> <p>Under-designed drive.</p> <p>Oil or grease on belts or sheaves.</p> <p>High temperatures.</p>  | <p>Replace with all new matched set, properly installed.</p> <p>Replace sheaves.</p> <p>Redesign.</p> <p>Remove source of oil or grease. Clean belts and grooves with cloth moistened with alcohol.</p> <p>Remove source of heat. Ventilate drive better.</p>  |
| <p><b>BELT TURN OVER</b></p>    | <p>Excess lateral belt whip.<br/>Foreign material in grooves.<br/>Mis-aligned sheaves.<br/>Worn sheave grooves (check with groove gauge).</p> <p>Tensile member broken through improper installation.<br/>Incorrectly placed flat idler pulley.</p>   | <p>Use Banded belt.<br/>Remove material—shield drive.<br/>Realign the drive.<br/>Replace sheave.</p> <p>Replace with new matched set properly installed.</p> <p>Carefully align flat idler on slack side of drive as close as possible to driver sheave.</p>   |
| <p><b>DETERIORATION OF RUBBER COMPOUNDS USED IN BELT</b></p> <p>Extreme cover wear.<br/>Spin burns on belt.<br/>Bottom of belt cracked.<br/>Broken belts.</p>   | <p>Belt dressing.</p> <p>Belts rub against belt guard or other obstruction.</p> <p>Belts slip under starting or stalling load.</p> <p>Too small sheaves.<br/>Object falling into or hitting drive.</p>  | <p>Never use dressing on V-belts. Clean with cloth moistened with alcohol.<br/>Tension drive properly to prevent slip.</p> <p>Remove obstruction or align drive to give needed clearance.<br/>Tighten drive until slipping stops.</p> <p>Redesign for larger sheaves.<br/>Replace with new matched set of belts.<br/>Provide shield for drive.</p> |
| <p><b>IMPROPER DRIVEN SPEED</b><br/>Incorrect driveR-driveN ratio.<br/>Spin burns on belt.</p>  | <p>Design error.</p> <p>Belt slip.</p>  | <p>Use correct sheave sizes.</p> <p>Re-tension drive until belt stops slipping.</p>  |
| <p><b>BELT NOISE<br/>HOT BEARINGS</b></p>   | <p>Belt slip.</p>   | <p>Re-tension drive until it stops slipping.</p>   |
| <p>Drive over-tensioned.<br/>Sheaves too small.<br/>Poor bearing condition.<br/>Sheaves out too far on shaft.<br/>Drive under-tensioned.</p>  | <p>Worn grooves-belts bottoming and will not transmit power until over-tensioned.<br/>Improper tensioning.<br/>Motor manufacturers sheave diameters not followed.</p> <p>Underdesigned bearing or poor bearing maintenance.</p> <p>Error or obstruction problem.</p> <p>Belts slipping and causing heat build-up.</p> | <p>Replace sheaves. Tension drive properly.</p> <p>Re-tension drive.<br/>Redesign drive.</p> <p>Observe recommended bearing design and maintenance.<br/>Place sheaves as close as possible to bearings.<br/>Remove any obstruction preventing this.</p> <p>Re-tension drive.</p>   |

## FHP Light Duty V-Drives

### The Economical Option For Smaller Drives

- Fractional thru 10 HP at 1750 RPM
- One or Two Groove
- Fixed Pitched or Variable Pitch
- Use Standard Belts FHP: 3L-4L-5L SL Classic: A or B Section Classic Cog: AX or BX

- Sizes AKQT, 2AKQT, BKQT, 2BKQT
- Durable Cast Iron Construction
- Industry Standard H-Style Bushing
- Interchangeable with QT and D Bushing
- Secure Clamp Fit to Shaft
- Bore Range 3/8 to 1-1/2"
- Integral Key Bushing Available in Select Bores
- Inch and Metric Bores
- Static Balance
- Suitable for Higher Capacity AX or BX Classic Cog Belts

### Variable Pitch Sheaves

- One and Two Grooves
- Selections Available up to 30HP, 1750 RPM
- Durable Cast Iron Construction
- Static Balance
- Driven Sheave Options: FHP Bored-to-Size, FHP QT-Bushed, Taper-Lock Dual Duty, QD Combination Duty

- Belt Options Include FHP, Classical
- Adjustment Range 1.3:1 (Approx.)
- Positive Locking of Adjustment Setting
- New Easy Selection Procedure
- Applications Include: Conveyors, Pumps, Fans, Mixers, Ventilators, etc.

### QT-Bushed Sheave

### Finish Bore Sheaves

- Sizes AK, 2AK, BK, 2BK
- Bored-to-Size
- Keyway and Setscrew
- Durable Cast Iron Construction
- Static Balance
- Stocked in Popular Sizes
- Not Recommended for Classic Cog Belts

**NOTE:** Selection tools available online at [www.dodge-pt.com](http://www.dodge-pt.com)

## SELECTION/DIMENSIONS

## SELECTION/DIMENSIONS

### LIGHT DUTY FIXED BORE SHEAVES 2BK (A & B V-BELTS)

- Finished Boe
- Keyway and (2) Setscrew
- Cast Iron, max speed 6500 FPM

TYPE 7

TYPE 8

A = Arms

B = Block

W = Web

| Shaft Dia.      | Keyseat     |
|-----------------|-------------|
| 1/2             | none        |
| 5/8 - 7/8"      | 3/16 X 3/32 |

## QT-Bushed Sheaves

### QT-Bushed Sheaves

- Sizes AKQT, 2AKQT, BKQT, 2BKQT
- Uses QT(L)-Style Bushing
- Secure Clamp Fit to Shaft
- Bore Range 3/8 to 1-1/2"
- Integral Key Bushing — Available in Select Bores
- Inch and Metric Bores
- Suitable for Higher Capacity AX or BX Classic Cog Belts

## AK (A & 3L - 4L V-BELTS) 1 GROOVE

# SELECTION

## FHP Fixed Speed Drives

### PROCEDURE

- 1. Calculate the Drive Ratio:** DriveR RPM divided by DriveN RPM.
- 2. Calculate the Design Horsepower:** Multiply motor HP by the “combined Correction Factor” listed below. If the exact type of machine is not listed, use the one that most nearly matches the application.
- 3. Select DriveR Sheave:** In the HP Rating Tables, scan the RPM column for the HP rating that is equal to or greater than the Design HP calculated in Step 2. The DriveR sheave size is listed in the left-hand column. Normally the smallest diameter sheave alternative that covers the Design HP will result in the most economical drive.
- 4. Select the DriveN Sheave:** Refer to the appropriate “Ratio Table”. Choose the DriveN Sheave at the intersection of the calculated ratio and the DriveR Sheave.
- 5. Select Belt Length:** Add DriveR and DriveN sheave diameters. Locate this number on the top row of the Center Distance Table. Trace down to the desired center distance in this column. The appropriate belt length will be listed in the left hand column. Belt length is indicated by the belt nomenclature: e.g., 4L350 is 35.0” long, 5L530 is 53.0” long, B36 is 36” long, etc.

**NOTE:** This procedure will provide approximate center distance. For more accurate results, refer to the “Non-Standard Drive Selection Procedure” for S-L Classic V-Drives.

**6. Two Belt Drives:** If the Design Horsepower is greater than the belt listed belt rating, divide the DHP by two, and proceed as though it were a single belt drive. **CAUTION:** FHP belts are not matched, and are therefore not normally recommended for two-belt drives. A, B, AX, or BX belts are matched and may be substituted. Also, these classical belts may have a significantly higher HP rating, which could allow for a more economical single belt drive.

| Driven Machine         | Speed Ratio |              |
|------------------------|-------------|--------------|
|                        | Under 1.5   | 1.5 and Over |
| Fans & Blowers         | 1.0         | 0.9          |

# SELECTION

## Center Distance/Belt Length

This table provides approximate center distance for the majority of V-Drives up to 3:1 ratio.

Data is useful for higher ratios, but if more accurate results are required, use the belt length formula found in the "Special Drives" selection section for S-L Classic drives.

| Belt Lgth. | Sum of Both V-Belt Sheave Diameters |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |  |  |  |
|------------|-------------------------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|--|--|--|

The centers shown in this shaded area are below the recommended minimum.

# SELECTION

## Variable Pitch Selection Procedure 1750 RPM Motors, Fractional Thru 30 HP

### PROCEDURE

1. Calculate design HP: Motor HP x Service Factor
2. Determine motor shaft size from NEMA B MOTOR chart.
3. Scan Tables 1 & 2 for VP sheave and belt profile combination that will accommodate motor shaft size and design HP.
4. Go to associated VP SHEAVE-BELT table. Trace down the column headed by the selected VP Sheave size until the desired driven speed range is reached. The Driven Sheave size will be listed in the "Driven Sheave" column.

5. Calculate belt length as follows:

If CD/D is greater than 1.5:

**FORMULA A:**  $L=2CD + 1.57(D+d)$

CD = Center Distance

D = Large Sheave diameter

d = small sheave diameter

If CD/D is less than 1.5:

**FORMULA B:**

$$L = 2 CD + 1.57 (D + d) + \frac{(D - d)^2}{4 CD}$$

**NOTE:** "L" Belt length is Outside Length for FHP belts, Pitch Length for Classical Belts (A, B, AX, BX)

### EXAMPLE

A fan is to be driven at a speed in the range of 1400 to 1200 RPM by a 10 HP, 1750 RPM motor. Center Distance is 26". Desired Service Factor is 1.3.

### SOLUTION

1. Calculate Design HP:  $10 \times 1.3 = 13$  DHP.
2. Check NEMA B Motor shaft size: 1-3/8", from Table 3.
3. Scan Tables 1 & 2 for VP sheave size that covers 13 DHP and has 1-3/8" shaft capacity. Choose 2VP65 with AX belt (Other larger sizes are also suitable).
4. Check Selection Table for 2-Groove A-Section Belts. Locate column headed by "2VP65". Trace down to the "1425/1175" RPM range, which covers the 1400/1200 requirement. Trace over to the left hand column for the Driven Sheave size: Find Driven Sheave "2AK74".
5. Calculate belt length: Note that CD/D is  $26/7.0 = 3.5$ . This is greater than 1.5, so "Formula A" can be used.  $L=2 \times 26 + 1.57(7.0+5.7)$ ,  $L = 72.0$ , Use Belt Size AX71 which has a pitch length of 72.3".

**NOTE:** Calculated center distance is for maximum driven RPM. Center distance at minimum RPM will be approx. 1" longer.

## TAPER-LOCK FLAT FACE PULLEYS

The TAPER-LOCK flat face pulley was designed primarily to be used with adjustable speed drives using wide range belts. They are made of quality gray iron and are carefully static balanced.

TAPER-LOCK bushings grip the shaft but can be easily removed. One of the outstanding features is that they go from "shelf-to-shaft" without costly reboring, keyseating or machining.

## DODGE Motor Bases TYPE A SLIDE MOTOR BASES

Type A Motor Bases are fabricated of steel which offers a base of rugged design, compact and smooth in appearance. These bases, which are designed to provide adequate travel, are fully adjustable by the use of a single adjusting screw and have elongated mounting holes in the base plate.

Order by base number. Bases are tapped to receive popular NEMA frames and can be tapped on order for others by specifying the frame size required. See table below.

| Base No.<br>Part No. | NEMA Motor Frame No. |                 | Travel | A     | B     | C     | D     | E     | F * | G     | H    | K    | L    |

\* Bases are tapped with national coarse threads for those motor frames not marked with an asterisk. Bases for motor frames marked with an asterisk will be drilled and tapped on order at an extra charge and will require "F" diameter bolts and nuts - when ordering specify NEMA motor frame size.

## DODGE Motor Bases TYPE B SLIDE MOTOR BASES

Type B Motor Bases are made of fabricated steel and include all of the same quality features as the Type A bases. Type B bases were primarily designed to be used where a base of heavier construction is required.

Order by base number. Bases are tapped to receive popular NEMA frames and can be tapped on order for others by specifying the frame size required. See table below.

| Base No.<br>Part No. | NEMA Motor Frame No. |              | Wt. | A     | B  | C     | D    | E    | F*  | G     | H    | K    | L    | M    | N    |

## Adjustable NEMA Motor Bases

DODGE Adjustable motor bases provide a convenient method for mounting standard NEMA-frame motors. Hex- screw "E" is used to adjust the drive center distance over range "K" for tensioning V-Belt and Synchronous belt drives. Once the drive is tensioned, bolts "J" are tightened for a secure, stable mounting of the motor.

# FEATURES/BENEFITS

## DYNA-SYNC Drives

### The Original Timing Drive

- Synchronized No-Slip Transmission
- No Lubrication Required
- Efficiency: Approximately 98%
- Low Maintenance
- Virtually No Backlash
- Constant Linear Velocity
- Drive Ratios to 8.5:1
- Pitches: XL, L, H, and XH

### DYNA-SYNC Pulley

- Tough, Tensile Cords, No-Stretch Fiberglass
- Durable Neoprene Rubber Body
- Long-Wearing Nylon Duck Facing
- Oil, Heat, and Ozone Resistant

- Dual-Sided Teeth Available for Serpentine Drives

- Clean, Compact TAPER-LOCK Design
- Easy-on/Easy-off
- Precision Manufactured in ISO9000 Certified Plant
- Flanged Design Standard on Driver Sizes

# SPECIFICATIONS

## DYNA-SYNC Pulleys - L, H

- † Dash 1 = Block, 2 = Web, 3 = Arm  
Letter "F" indicates pulley is flanged
- + Available from stock in Min. Plain Bore (MPB) only  
Max. bore is without keyway. (If keyway is used, reduce max bore listed by twice the keyway depth.)
- ◇ See page PT10-9 for additional MPB sizes

# SELECTION

## DYNA-SYNC Drives

### USING STANDARD MOTOR SPEEDS

**Step 1—Determine Service Factor** from steps on page PT10-16.

**Step 2—Compute Design HP.** Multiply normal running HP required or nameplate rating by service factor obtained in Step 1.

**Step 3—Choose Belt Section.** Using Table 1, read up from design HP figure obtained in Step 2 and over from the RPM of faster shaft. This intersection indicates belt section.

**Step 4—Select the Drive, a).** Using the belt section from Step 3, refer to Selection Tables beginning on page PT10-18. **b).** Under appropriate standard full-load motor RPM, find the driven RPM nearest to the desired speed. Trace right to columns headed “Pulley Combination.” If more than one is listed, the combination with the largest pulleys usually will offer the best belt life. (Note that one pulley must be flanged on all drives. If center distance exceeds 8 times P.D. of small pulley or shafts are vertical

or inclined, both must be flanged.) **c).** On same line trace right to the figure nearest the desired center distance and at top of column note belt number. **d).** Trace back on same line to appropriate column under heading “HP for a 1” Belt...” Divide the design HP obtained in Step 2 by the HP thus found in table. (Divide this value by Teeth in Mesh (T.I.M.) factor when applicable.) The result is the Belt Width Factor. Refer to table below right hand selection table to determine belt width required. If width shown is not stock go to next stock width listed. Add belt code, from table, to belt number found in Step 4c. (If wider stock belt is not shown in table, redesign drive to next larger pitch.) To check drive calculation: HP for a 1” Wide Belt x Belt Width factor x Teeth in Mesh factor = Actual HP rating of the drive. If actual rating is equal to or greater than Design HP, selection is O.K.

**NOTE:** Good practice dictates that shaft and bushing system (or alternate shaft mounting method) be verified for adequate rating.

## DYNA-SYNC Drives

### USING STANDARD MOTOR SPEEDS

#### EXAMPLE OF SELECTION

Select a drive for a 3 cylinder reciprocating compressor to run 8 hours a day at about 270 RPM and to be driven by a 5 HP, 1160 RPM Design B squirrel cage motor. Centers are about 25”.

**Step 1**–Service Factor from page PT10-16 is 2.2.

**Step 2**–Design HP = 5 x 2.2 = 11 HP.

**Step 3**–An “H” Cross Section is shown in Table 1 when reading to the right of 1160 RPM of faster shaft and up from 11 design HP.

**Step 4**–The H-Section drive tables begin on page PT10-30. On page PT10-34, the nearest driven speed for

a 1160 RPM motor is 271 RPM. Two possible pulley combinations are listed. The 28H driver/120H driven is preferred. On the same line the nearest center distance to 25” is 25.45”. Note the 900 H belt at top of column. Tracing back on the same line, under 1160 RPM, the “HP for a 1” Belt” is 5.68. 11 design HP 5.68 = 1.937 Belt Width Factor. Belt Width Table indicates a 2” wide belt is required. Add code number 200 to belt and pulley number and order the following: (1) TL28H200 DYNA-SYNC Pulley, (1) 2012 Taper-Lock (1) TL120H200 pulley. (1) TAPER-LOCK 3020 bushing. (1) 900H200 DYNA-SYNC Belt. To facilitate delivery, order by part numbers listed in Pulley, Bushing and Belt sections of this catalog.

**Table 1 - Synchronous Cross Section Selection Chart**

# SELECTION

## Service Factor

To determine the service factor for a DYNA-SYNC drive follow the three steps below.

**Step 1.** Determine the class of Driver from Table 2 below.

**Step 2.** Use Class of Driver and Type of Application in Table 4 at right to find the tentative service factor.

**Step 3.** Add the Additional Service Factor, when applicable, from Table 3 at bottom of page to the tentative service factor from Step 2 to determine the service factor for the application.

**Table 2 - Class of Driver**

| Driver                                 | Class I   | Class II      | Class III        |
|--|-----------|---------------|------------------|
| A-C Electric Motors, Single Phase..... | .....     | .....         | All              |
| Squirrel Cage, NEMA Design A,          |           |               |                  |

| Line Shafts .....                      | .....     | .....         | All              |

**Table 3 - Additional Service Factors †**

| Condition                                | Additional Factor |
|--|-------------------|
| 24 hour continuous operation .....       | 0.2               |
| Use of an idler .....                    | 0.2               |
| Intermittent or seasonal operation ..... | ◊                 |
| Speed up drive:                          |                   |
| 1 to 1.24 ratio .....                    | 0.0               |
| 1.25 to 1.74 ratio .....                 | 0.1               |
| 1.75 to 2.49 ratio .....                 | 0.2               |
| 2.50 to 3.49 ratio .....                 | 0.3               |
| Over 3.49 ratio .....                    | 0.4               |

† Additional service factors other than listed here are required for unusual condition such as torque reversal, heavy shock, when current to motor is reversed to either stop the motor rapidly or to run it in opposite direction, or when a brake is to be used. For such applications consult factory.

◊ Subtract 0.2 from tentative service factor.

**Table 4 - Service Factors\***

| Application  | Class |     |     |

## DYNA-SYNC Drives

### FOR SPEEDS OTHER THAN STANDARD MOTOR SPEEDS AND SPEED-UP DRIVES

#### For Speeds Other Than Standard Motor Speeds

**Step 1 – Calculate Speed Ratio** =  $\frac{\text{Driver RPM}}{\text{Driven RPM}}$

**Step 2 – Determine Service Factor** from steps on page PT10-16.

**Step 3 – Calculate Design HP.** Multiply normal running HP required or nameplate rating by service factor obtained in Step 2.

**Step 4 –** Using Table 1 on page PT10-15 read up from design HP obtained in Step 3 and over from RPM of faster shaft. This intersection indicates belt section.

**Step 5 – Select the Drive. a.)** Using the belt section obtained in Step 4, refer to Selection Tables beginning on PT10-18. **b.)** Read down ratio column to the value nearest to one calculated in Step 1. Trace right to columns headed “Pulley Combinations.” If more than one is listed, the combination with the largest pulleys usually will offer the best belt life. (Note that one pulley must be flanged on all drives. If center distance exceeds 8 times P.D. of small pulley or shafts are vertical or inclined, both must be flanged.) **c.)** On the same line trace right to figure nearest the desired center distance and at top of column note belt number. **d.)** Now go to the HP Table for the appropriate belt section. Reading to the right of the speed of the faster pulley and down from the pulley size, the HP figure for a 1” belt will appear. Divide the design HP from Step 3 by the HP thus found in table. (Divide this value by Teeth in Mesh factor, when applicable.) The result is the Belt Width Factor. Refer to table below the HP Table to determine belt width factor required. If width shown is not in stock go to next stock width listed. Add belt code, from table, to belt number found in Step 5c. (If wider stock belt is not shown in table, redesign drive to next larger pitch).

#### EXAMPLE OF SELECTION

A printing machine embossing roll runs at 426 RPM, powered from an 800 RPM line shaft. The roll required 7 HP. Machine runs 8-10 hrs. a day. Center distance is approx. 20”.

**Step 1 – Speed Ratio** = 1.88

**Step 2 – Service Factor** = 1.8

**Step 3 – Design HP** = 7 x 1.8 = 12.6

**Step 4 – Belt Selection** from Table 1 = H

**Step 5 –** The H Section Drive Tables begin on page

PT10-30. The ratio of 1.88 obtained in Step 1 is found on page PT10-32. Two pulley combinations are listed. The 32H driver /60H driven is preferred. On the same line the nearest center distance to 20” is 19.88. Note the 630H belt at top of column. Refer to H section HP Tables on page PT10-42. Opposite 800 RPM of faster shaft and under 32H pulley, the HP 4.50 = 2.8. This is the belt width factor. Referring to the H belt width table a 3” wide belt is stock. Add the 300 Code Width to the pulley and belt numbers and order the following:

(1) TL32H300 DYNA-SYNC Pulley, (1) 2517 TAPER-LOCK bushing (Check to see if bushing will fit equipment shafts). (1) TL60H300 Pulley.

(1) 3020 bushing

(1) 630H300 DYNA-SYNC Belt.

To facilitate delivery, use part numbers listed in Pulley, Bushing and Belt sections of this catalog.

#### Example of a Speed-Up Drive

Select a drive for a continuous duty liquid agitator to run at about 2000 RPM and to be driven by a 10 HP, 1750 RPM squirrel cage motor Centers are about 10”.

**Step 1 – Speed ratio** is  $2000 \div 1750 = 1.14$ .

**Step 2 – Service factor** from page PT10-3 is 1.8

**Step 3 – Design HP** =  $10 \times 1.8 = 18$  HP.

**Step 4 –** An “H” Cross Section is shown in Table 1 when reading to the right of 2000 RPM and up from 18 design HP.

**Step 5 –** Speed ratio calculated in Step 1 appears in Selection Table on page PT10-30. Two possible pulley combinations are listed. The 28H driver/32H driven is preferred. In a Speed-Up Drive, the 28H becomes the driven, the 32H, the driver. On the same line the nearest center distance to 10” is 10.5. Note the 360H belt at top of column. Referring to HP table on page PT10-42, the rating for a 1” wide belt is shown as 9.60 for a 28H pulley at 2000 RPM.  $18 \text{ design HP} \div 9.60 = 1.875$  Belt Width Factor Belt Width Table indicates a 2” wide belt is required. Add code number 200 to belt and pulley number and order the following: (1) TL32H200 DYNA-SYNC Pulley, (1) 2517 TAPER-LOCK Bushing. (Check to see if bushings will fit equipment shafts). (1) TL28H200 Pulley, (1) 2012 bushing (with 2, max. bore). (1) 360H200 DYNA-SYNC belt.

\* **Selection program available online at [ptwizard.com](http://ptwizard.com).**

Δ HP ratings are for conventional speed-reduction drives.

† See Teeth in Mesh table on opposite page

For Speed-Up Drives refer to page PT10-17.

◊ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

Δ HP ratings are for conventional speed-reduction drives.

For Speed-Up Drives refer to page PT10-17.

◊ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

† † See Teeth in Mesh table on opposite page.

♥ Flanges Required on both pulleys.

Δ HP ratings are for conventional speed-reduction drives.

† ‡ § See Teeth in Mesh table on opposite page.

For Speed-Up Drives refer to page PT10-17.

♥ Flanges Required on both pulleys.

◊ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

Δ HP ratings are for conventional speed-reduction drives.

† ‡ § See Teeth in Mesh table on opposite page.

For Speed-Up Drives refer to page PT10-17.

◇ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

Δ HP ratings are for conventional speed-reduction drives.

† ‡ See Teeth in Mesh table on opposite page.

For Speed-Up Drives refer to page PT10-17.

◇ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

Δ HP ratings are for conventional speed-reduction drives.

† ‡ § ♣ See Teeth in Mesh table on opposite page.

For Speed-Up Drives refer to page PT10-17.

♥ Flanges Required on both pulleys.

◇ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

Δ HP ratings are for conventional speed-reduction drives.

♥ Flanges Required on both pulleys.

For Speed-Up Drives refer to page PT10-17.

◊ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

Δ HP ratings are for conventional speed-reduction drives.

♥ Flanges Required on both pulleys.

For Speed-Up Drives refer to page PT10-17.

◇ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

Δ HP ratings are for conventional speed-reduction drives.

For Speed-Up Drives refer to page PT10-17.

◇ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

† ‡ § See Teeth in Mesh table on opposite page.

♥ Flanges Required on both pulleys.

Δ HP ratings are for conventional speed-reduction drives.

♥ Flanges Required on both pulleys.

For Speed-Up Drives refer to page PT10-17.

◇ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

Δ HP ratings are for conventional speed-reduction drives.

† † See Teeth in Mesh table on opposite page.

For Speed-Up Drives refer to page PT10-17.

♥ Flanges Required on both pulleys.

◇ Pulley Diameter is below recommended minimum. A reduction in belt life should be expected. Suggest alternate drive selection, whenever possible.

### XL Belt Width Table

| Belt Width Factor | .15 | .28 | .35  | .42 | .57 | .71 | .86 | 1.00 | 1.29  | 1.56  |
|-------------------|-----|-----|------|-----|-----|-----|-----|------|-------|-------|
| Belt Width        | 1/4 | 3/8 | 7/16 | 1/2 | 5/8 | 3/4 | 7/8 | 1    | 1-1/4 | 1-1/2 |
| Belt Width Code   | 025 | 037 | 043  | 050 | 062 | 075 | 087 | 100  | 125   | 150   |

Shaded area indicates stock belt widths.

◇ Pulley diameter is below recommended minimum.

A reduction in belt life should be expected. Suggest alternate drive, when ever possible.

| Belt Width Code   | 037 | 043  | 050 | 062 | 075 | 087 | 100  | 125   | 150   | 175   | 200  | 250   | 300  |

Shaded area indicates stock belt widths.

Δ Special non-stock sizes.

† Belt Speed exceeds 6500 FPM – consult Dodge.

◇ Pulley diameter is below recommended minimum.

A reduction in belt life should be expected. Suggest alternate drive, when ever possible.

Shaded area indicates stock belt widths.

Δ Special non-stock sizes.

† Belt Speed exceeds 6500 FPM – consult Dodge.

◇ Pulley diameter is below recommended minimum.

A reduction in belt life should be expected. Suggest alternate drive, when ever possible.

### XH, XXH Belt Width Table

| Belt Width Factor | 1.00 | 1.29  | 1.56  | 1.84  | 2.14 | 2.72  | 3.36 | 4.06  | 4.76 | 6.15 | 7.50 | 8.89 | 10.32 | 11.70 | 13.10 | 14.41 | 15.84 | 17.16 | 18.62 |
|-------------------|------|-------|-------|-------|------|-------|------|-------|------|------|------|------|-------|-------|-------|-------|-------|-------|-------|
| Belt Width        | 1    | 1-1/4 | 1-1/2 | 1-3/4 | 2    | 2-1/2 | 3    | 3-1/2 | 4    | 5    | 6    | 7    | 8     | 9     | 10    | 11    | 12    | 13    | 14    |
| Belt Width Code   | 100  | 125   | 150   | 175   | 200  | 250   | 300  | 350   | 400  | 500  | 600  | 700  | 800   | 900   | 1000  | 1100  | 1200  | 1300  | 1400  |

Shaded area indicates stock belt widths.

† Belt Speed exceeds 6500 FPM – consult Dodge.

◇ Pulley diameter is below recommended minimum.

A reduction in belt life should be expected. Suggest alternate drive, when ever possible.

△ Stock with XXH Series only.

## Dimensions, Tolerances, etc.

Warning - Do not use DYNA-SYNC Pulleys with belt speed exceeding 6500 fpm. May cause pulleys to fragment resulting in personal injury or property damage.

### Concentricity and Face Run-Out Tolerances

| Runout (T.I.R. $\phi$ ) | O.D.   | Tol.  |
|-------------------------|--|-------|
| Radial                  | 8" & under                                       | .005" |
|                         | For each add'l. inch of O.D. add .0005"          |       |
| Axial                   | 1" & Under                                       | .001" |
|                         | For each add'l. inch of O.D. thru 10" add .001"  |       |
|                         | For each add'l. inch of O.D. over 10" add .0005" |       |

$\phi$ Total Indicator Reading

### Reborable Pulley Bore Tolerances

| Bore Size      | Tol.            |
|----------------|-----------------|
| 15/16" & Under | .0010" - .0000" |
| 1" to 1-15/16" | .0015" - .0000" |
| 2" to 2-15/16" | .0020" - .0000" |
| 3" & Over      | .0025" - .0000" |

**Rebore Charges**—Reborable pulley alteration charges are shown in MLP Price Book. TAPER-LOCK pulleys accommodate all common tolerance variations found in commercial shafting.

**Balancing**—All DYNA-SYNC Pulleys have been given a careful static balance for operation up to 6500 FPM. When vibration is a problem, dynamic balancing is recommended – Consult price book MLP. (See Warning above)

**Special Pulleys**—In 1/5 thru 1-1/4" pitches, pulleys can be made to suit customer's specifications and may be furnished in sizes not listed on previous pages. Send us your inquiry.

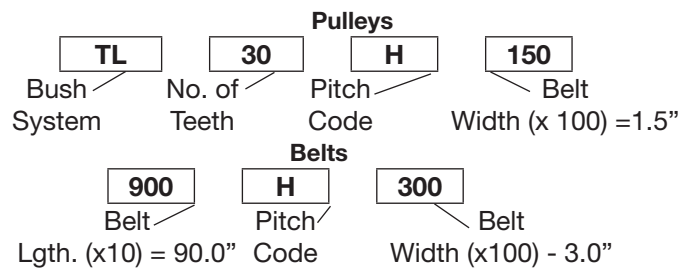

### Standard Keyways

| Bore Range               | Keyway      |
|--------------------------|-------------|
| 5/16 - 7/16 Incl.        | 3/32 x 3/64 |
| Over 7/16 - 9/16 Incl.   | 1/8 x 1/16  |
| Over 9/16 - 7/8 Incl.    | 3/16 x 3/32 |
| Over 7/8 - 1-1/4 Inc.    | 1/4 x 1/8   |
| Over 1-1/4 - 1-3/8 Inc.  | 5/16 x 5/32 |
| Over 1-3/8 - 1-3/4 Incl. | 3/8 x 3/16  |
| Over 1-3/4 - 2-1/4 Inc.  | 1/2 x 1/4   |
| Over 2-1/4 - 2-3/4 Incl. | 5/8 x 5/16  |
| Over 2-3/4 - 3-1/4 Incl. | 3/4 x 3/8   |

### Pulley Outside Diameter/Diameter Over Belt

| Pitch | Pulley O.D.   | Diameter Over Belt |
|-------|---------------|--------------------|
| XL    | P.D. - 0.02"  | P.D. + 0.08"       |
| L     | P.D. - 0.03"  | P.D. + 0.11"       |
| H     | P.D. - 0.054" | P.D. + 0.11"       |
| XH    | P.D. - 0.11"  | P.D. + 0.27"       |

## Installing / Tensioning DYNA-SYNC Drives

### Alignment

Use straight edge to check parallel and offset alignment. Align pulleys within 1/4° or 1/16" per foot center distance. Supporting framework must be rigid.

### Pulley Flanges

At least one pulley must have flanges. If center distance is more than 8 times the diameter of the smallest pulley, both pulleys should be flanged. Vertical shaft drives may require flanges on both pulleys.

### Installation

Reduce center distance so that belt can be slipped into place without forcing. Do not pry belt onto pulleys. Increase center distance to tighten belt. Belt should be snug, but not excessively tight. If belt has a tendency to "jump teeth" during operation, increase belt tension.

### Idlers

Adjustable center distance is preferred over idlers to tension belt. Idlers should be positioned on the slack side of the drive. Inside idlers are preferred over outside idlers. Idler diameter should be at least as large as the smallest pulley.

### TENSIONING THE DRIVE –

Simple Tensioning Procedure:

**Step 1** – Calculate the value of the deflection force "f" from the following formula, referring to drawing below.

$$\text{Force of Deflection } f = \frac{T + (S/L) K}{16}$$

Where S = Span distance in inches

T = Tension in Lbs. from Table below

K = Constant from Table

L = Length of Belt

**Step 2** – Using a straight edge as a reference, apply enough force to deflect belt 1/64" for every inch of center span. If this force is less than the calculated "f", increase center distance of pulleys. If more than "f", decrease center distance of pulleys.

**Belt Deflection Force T and K Values**

| Belt Pitch | Values # | Belt Width |      |      |      |      |      |       |     |       |     |      |      |      |      |      |  |
|------------|----------|------------|------|------|------|------|------|-------|-----|-------|-----|------|------|------|------|------|--|
|            |          | 1/4        | 3/8  | 1/2  | 5/8  | 3/4  | 1    | 1-1/2 | 2   | 2-1/2 | 3   | 4    | 5    | 6    | 8    | 10   |  |

# FEATURES/BENEFITS

## DODGE HT200 Drives

### High Torque Synchronous Belt Drives

- 200% Rating of HTD
- Quieter Operation
- More Compact
- 8MM & 14MM Pitch

### Plus all the benefits of standard HTD Drives:

- Positive, non-slip drive
- No lubrication required
- Non-stretch
- Corrosion resistant
- Abrasion resistant
- Virtually no backlash
- Clean operation
- Long life
- Low maintenance

## THE TECHNOLOGY OF HT200 PERFORMANCE

### Advanced Tooth Profile Design

- Optimizes distribution of load forces between belt and sprocket.
- Improves dynamic efficiency between sprocket and belt.
- Increases torque capacity.
- Allows more compact, narrower drive.
- Operates more quietly.

### Belt Construction

- Tougher Chloroprene rubber resists tooth shear, increases load capacity.
- Strong, stretch-resistant tensile cords.
- Tough, wear-resistant nylon tooth facing keeps friction low, protects from wear.

### HT200

- Compact Design
- Uses HT TAPER-LOCK Sprockets
- Competitively Priced

V-Drives

FHP Drives

Drive Component Accessories

DYNA-SYNC

HT200/HTD Synchronous Drives

HT500 Synchronous Drives

Roller Chain Sprockets

# FEATURES/BENEFITS

## DODGE HT200 Drives

### HT TAPER-LOCK Sprockets

- **Torque Rated:** Shaft gripping strength to meet the higher demands of the 200% rating of HT200 Belts.
- **Compatible:** Accepts HT200 or standard HTD belts.
- **Compact:** Save shaft space with compact TAPER-LOCK design.
- **Reduce Overhung Load:** Compact design allows closer mounting to motor or reducer bearings. Improves bearing life, reduces maintenance costs.

### TAPER-LOCK THE Compact Synchronous Drive

TAPER-LOCK HT

FLANGE-BUSHED SPROCKET

Compact TAPER-LOCK design takes up less shaft space than narrow width belts or products using flanged style bushing. The result is a more compact, economical synchronous drive.

### BELT NOMENCLATURE

### DODGE QD HTD Sprockets

- Rated for capacity of standard HTD belts.
- Compatible for standard HTD belts.
- Can run HT200 belts at HTD rating.
- Use HT200 belts for quieter operation than with HTD belts.

**Caution:** Standard QD style HTD sprockets manufactured by DODGE or by others may not have the torque capacity for the higher rated HT200 belts. HT TAPER-LOCK sprockets from DODGE are designed to handle the higher loads.

### Upgrade Roller Chain Drives to DODGE HT200

- **Clean:** No lubrication required. No messy oil drips or spills.
- **Quiet:** No metal-to-metal contact.
- **Smooth Operation:** No chordal action of chain drive that results in vibration and speed variation.
- **Economical Drive Guard:** Basic enclosed or ventilated guard will suffice. Oil seals, filler and drain plugs not required.

### SPROCKET NOMENCLATURE

## SPECIFICATION

### HT TAPER-LOCK Sprockets

The figure following the sketch reference letter in the "Type" column, indicates the construction of the sprocket (1 = Solid, 2 = Web, and 3 = Arms) and the letter "F" indicates that the sprocket has flanges.

Roller Chain Sprockets

## HT TAPER-LOCK Sprockets

The figure following the sketch reference letter in the "Type" column indicates the construction of the sprocket (1 = Solid, 2 = Web and 3 = Arms), and the letter "F" indicates that the sprocket has flanges.

## SPECIFICATION

### QD HTD Sprockets

The figure following the sketch reference letter in the "Type" column indicates the construction of the sprocket (1 = Solid, 2 = Web, and 3 = Arms), and the letter "F" indicates that the sprocket has flanges.

### 5MM QD HTD Sprockets

## QD HTD Sprockets

The figure following the sketch reference letter in the "Type" column indicates the construction of the sprocket (1 = Solid, 2 = Web, and 3 = Arms), and the letter "F" indicates that the sprocket has flanges.

### 8MM QD HTD Sprockets

## SPECIFICATION

### QD HTD Sprockets

The figure following the sketch reference letter in the "Type" column indicates the construction of the sprocket (1 = Solid, 2 = Web, and 3 = Arms), and the letter "F" indicates that the sprocket has flanges.

#### 14MM QD HTD Sprockets

## SPECIFICATION

### QD HTD Sprockets

The figure following the sketch reference letter in the "Type" column indicates the construction of the sprocket (1 = Solid, 2 = Web, and 3 = Arms), and the letter "F" indicates that the sprocket has flanges.

#### 20MM QD HTD Sprockets

# SPECIFICATION

## DODGE H200 Belts

- 200% Rating of HTD Belts
- For Use on TAPER-LOCK HT Sprockets

**Note:** Belt length is in millimeters  
To convert to inches, divide by 25.4

**Example:** 2600-8M-30 belt size  
 $2600 \div 25.4 = 102.36$  inches belt length

## SPECIFICATION

### DODGE H200 Belts

- 200% Rating of HTD Belts
- For Use on TAPER-LOCK HT Sprockets

**Note:** Belt length is in millimeters  
To convert to inches, divide by 25.4

**Example:** 2600-8M-30 belt size  
 $2600 \div 25.4 = 102.36$  inches belt length

## PROCEDURE

### 1. Obtain required information:

- Motor name plate HP
- Motor or DriveR RPM and Shaft size
- DriveN Machine RPM and Shaft size
- Approximate center distance
- Service factor information

### 2. Determine Service Factor: (Page PT11-20)

- Determine type of Driven Machine from Table 1
- Choose Basic Service Factor in appropriate column of the following S.F. Table
- Add additional service factor for slow speed drives, idlers or speed up drives were applicable

### 3. Calculate Design Horsepower:

- Multiply Motor HP or normal running HP times Service Factor from Step 2
- Note: Recommended Min. Sprocket Diameter, if applicable, from NEMA table on page PT11-21.

### 4. Determine Belt Pitch: (Page PT11-21)

- Choose belt pitch based upon Design HP and RPM of faster shaft

### 5. Select Smaller Sprocket:

- Look at Basic HP rating tables of belt Pitch selected in Step 4
- Scan HP rating at RPM of faster shaft. (Pg. PT11-22 thru PT11-26)
- Find sprocket size(s) that have HP rating at or above Design HP

### 6. Calculate Drive Speed Ratio:

- Divide Fast Shaft RPM by Slow Shaft RPM

### 7. Select Sprockets and Belt:

- Refer to "Ratio/Center Distance" Tables for Belt pitch chosen in Step 4. (Pg. PT11-35 - PT11-65)
- Trace down left hand column to approximate ratio calculated in Step 6
- Choose drive that has small sprocket at or above the number of teeth determined in Step 5
- On this same line, trace to the right until the number closest to the required center distance is reached
- Trace to the top of this column and note the belt size that gives this center distance
- Also note the "Belt Length Correction Factor" at the top or bottom of this same column

### 8. Finalize Selection:

- Multiply "Belt Length Correction Factor" times indicated rating obtained from HP table
- Verify that Design HP is equal to or less than this corrected HP value
- Note: If Correction Factor is greater than 1.0 corrected HP may allow selection of smaller less expensive drive

### 9. Specify Drive:

- DriveR Sprocket and Bushing
- DriveN Sprocket and Bushing
- Belt
- Verify that bushing bore has capacity for shaft size

## Example

**Step 1. Required Information:** Select a HTR/HTRC drive to connect a 15HP APG gearmotor to a package conveyor headshaft. Reducer output is 125 RPM, shaft size is 2". Headshaft is 2-3/4" and is to run at 70 RPM. Center distance is 19-23", operation is 14 hrs/day.

**Step 2: Service Factor:** Package Conveyor requires 1.4 basic Service Factor. Add 0.3 for slow speed drive application (step 2 at left). Net S.F. = 1.7

**Step 3. Design HP:**  $1.7 \times 15 = 25.5$  HP.

**Step 4. Belt Pitch:** Referring to page PT11-21, most probable belt pitch for 25.5 Des. HP at 125 RPM is 14MM.

**Step 5. Select Small Sprocket:** Scan 14MM HP Tables. Since there is no 125 RPM line, it will be necessary to interpolate. Start with the 100 RPM line. Observe that a 38 tooth sprocket for a 115MM wide belt gives 23.5 HP. Interpolation for 125 RPM gives 29.2 HP. Other alternatives are also available (see below)

**Step 6. Drive Ratio:**  $125 / 70 \text{ RPM} = 1.79:1$

**Step 7. Sprocket Selection:** Refer to 14MM Ratio/Center Distance tables. For 1.79 ratio, note that there are 5 drive combinations in the 1.78 to 1.8 range. The 38 tooth DriveR and the 68 tooth DriveN combination appears to be good, however we need to account for the belt length correction factor of .95, which gives us a net design HP of 27.7. (Note 20.2" C.D. requires a 1778 length code belt)

**Step 8. Finalize Selection:** Select the 38 to 68 tooth combination with a 1778 length code belt for 20.2" C.D. From step 7, rated HP is 27.7

There are many optional drive selections. For drive verification or complete list of choices run ViaSync at [www.ptwizard.com](http://www.ptwizard.com).

### Step 9. Specify Drive:

#### Original Selection:

DriveR Sprocket: P38-14M-115-3020, P/N **114520** Bushing. 3020 x 2", P/N **117118**

DriveN Sprocket: P68-14M-115-4545, P/N **114528** Bushing. 4545 x 2-3/4", P/N **117426**

Belt: 1778-14M-115 HT200 Belt, P/N **146602** Shaft capacity is verified by availability of bore sizes.

Selection program available online at [ptwizard.com](http://ptwizard.com)

| Centrifuges, Screw Conveyors Hammer Mill, Paper Pulpers, Textile Machinery  | 1.5                             | 1.7                | 1.9                 | 1.9                             | 2.1                | 2.3                 |
| Blowers: Positive Displacement, Mine Fans, Pulverizers  | 1.6                             | 1.8                | 2.0                 | 2.0                             | 2.2                | 2.4                 |
| Compressors: Reciprocating, Crushers: Gyratory, Jaw, Roll, Mills: Ball, Rod, Pebble, etc., Pumps: Reciprocating Saw Mill Equipment  | 1.7                             | 1.9                | 2.1                 | 2.1                             | 2.3                | 2.5                 |

These service factors are adequate for most belt drive applications. Note that service factors cannot be substituted for good engineering judgment. Service factors may be adjusted based upon an understanding of the severity of actual drive operation conditions.

### Additional Service Factors

#### Low Speed Drives

| 8mm, 14,, & 20mm Belts Only |         |
|-----------------------------|---------|
| Smaller Sprocket Speed      |         |
| Up to 200 rpm               | Add 0.3 |
| 201 to 400 rpm              | Add 0.2 |
| 401 to 600 rpm              | Add 0.1 |
| Each Idler                  | Add 0.2 |

#### Speed-up Drives

For speed up drives, add the basic service factor to the additional factor given below.

| Speed-up Ratio Range | Additional Factor | Speed-up Ratio Range | Additional Factor |
|----------------------|-------------------|----------------------|-------------------|
| 1 to 1.24            | none              | 2.5 to 3.49          | 0.3               |
| 1.25 to 1.74         | 0.1               | 3.5 & over           | 0.4               |
| 1.75 to 2.49         | 0.2               |                      |                   |

#### Unusual Conditions

Additional service factors are required for unusual conditions such as a load reversal, heavy shock, plugged motor stop, electric brake. Consult factory or recommendation.

## Belt Pitch Selection Guide

Synchronous belt drive noise increases as a function of Design Horsepower and operating RPM. This is indicated on the chart at the left. Provisions should be made to design drive guards for sound absorption accordingly.

### Recommended Minimum Sprocket Diameters & Face Width Synchronous Belt Drives Used On General Purpose Electric Motors

| Motor Horsepower | Min. Sprocket Dia. (in.) |       |       |      | Maximum Face Width |       |       |      |
|------------------|--------------------------|-------|-------|------|--------------------|-------|-------|------|
|                  | 870                      | 1160  | 1750  | 3450 | 870                | 1160  | 1750  | 3450 |
| 1/2              | 2.0                      | -     | -     | -    | 2.25               | -     | -     | -    |
| 3/4              | 2.16                     | 2.0   | -     | -    | 2.25               | 2.25  | -     | -    |
| 1                | 2.16                     | 2.16  | 2.0   | -    | 2.75               | 2.25  | 2.25  | -    |
| 1-1/2            | 2.16                     | 2.16  | 2.16  | 2.0  | 2.75               | 2.75  | 2.25  | 2.25 |
| 2                | 2.7                      | 2.16  | 2.16  | 2.16 | 3.38               | 2.75  | 2.25  | 2.25 |
| 3                | 2.7                      | 2.7   | 2.16  | 2.16 | 3.38               | 3.38  | 2.75  | 2.25 |
| 5                | 3.42                     | 2.7   | 2.7   | 2.16 | 4.0                | 3.38  | 2.75  | 2.75 |
| 7-1/2            | 4.0                      | 3.42  | 2.7   | 2.7  | 4.0                | 4.0   | 3.38  | 2.75 |
| 10               | 4.0                      | 4.0   | 3.42  | 2.7  | 4.63               | 4.0   | 3.38  | 3.38 |
| 15               | 4.7                      | 4.0   | 4.0   | 3.42 | 4.63               | 4.63  | 4.0   | 3.38 |
| 20               | 5.4                      | 4.7   | 4.0   | 4.0  | 5.25               | 4.63  | 4.0   | 4.0  |
| 25               | 6.12                     | 5.4   | 4.0   | 4.0  | 5.25               | 5.25  | 4.63  | 4.0  |
| 30               | 6.12                     | 6.12  | 4.7   | -    | 5.87               | 5.25  | 4.63  | -    |
| 40               | 7.4                      | 6.12  | 5.4   | -    | 5.88               | 5.88  | 5.25  | -    |
| 50               | 7.6                      | 7.4   | 6.12  | -    | 7.25               | 5.88  | 5.25  | -    |
| 60               | 9.0                      | 8.1   | 6.7   | -    | 7.25               | 7.25  | 5.88  | -    |
| 75               | 8.6                      | 9.0   | 7.8   | -    | 8.5                | 7.25  | 5.88  | -    |
| 100              | 10.8                     | 9.0   | 7.8   | -    | 8.5                | 8.5   | 7.25  | -    |
| 125              | 11.3                     | 10.8  | 9.5   | -    | 8.5                | 8.5   | 7.25  | -    |
| 150              | 11.88                    | 11.88 | 9.5   | -    | 11.63              | 8.5   | 8.5   | -    |
| 200              | 11.88                    | 11.88 | 11.88 | -    | 11.63              | 11.63 | 11.63 | -    |
| 250              | 13.5                     | 11.88 | 11.88 | -    | 11.63              | 11.63 | 9.38  | -    |
| 300              | -                        | -     | 11.88 | -    | -                  | 11.63 | 11.63 | -    |
| 350              | -                        | -     | 11.88 | -    | -                  | 11.63 | 11.63 | -    |
| 400              | -                        | -     | 12.69 | -    | -                  | -     | 11.63 | -    |

**NOTE:** For a given motor horsepower and speed, the total belt pull is related to the motor sprocket size. As this size **decreases**, the total belt pull **increases**. Therefore, to limit the resultant load on motor shaft and bearings, NEMA lists minimum sprocket sizes for the various motors. The sprocket on the motor (DriveR Sprocket) should be at least this large.

# SELECTION

## HT200 Basic Horsepower Rating

NOTE: Multiply rating by Belt Length Correction Factor from Ratio/Center Distance Tables

| 8M-20 | Rated Horsepower for Small Sprocket<br>(Number of Teeth and Pitch Diameter, Inches) |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |

Shaded area indicates sprocket and RPM which can be used only if a reduction in belt life is allowable.

Operation in shaded area will result in a reduction of belt life.

\* Operation in this speed range may require sound dampening guard.

Operation in shaded area will result in a reduction of belt life.  
 \* Operation in this speed range may require sound dampening guard.

Operation in shaded area will result in a reduction of belt life.

\* Refer to page PT11-20 for additional Service Factors for speeds of 600 RPM or less.

= Drives within this speed range may generate an objectionable noise level. This can be reduced by using commercially available acoustical damping material in the belt guard.

Operation in shaded area will result in a reduction of belt life.

\* Refer to page PT11-20 for additional Service Factors for speeds of 600 RPM or less.

= Drives within this speed range may generate an objectionable noise level. This can be reduced by using commercially available acoustical damping material in the belt guard.

Operation in shaded area will result in a reduction of belt life.

\* Refer to page PT11-20 for additional Service Factors for speeds of 600 RPM or less.

= Drives within this speed range may generate an objectionable noise level. This can be reduced by using commercially available acoustical damping material in the belt guard.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged. Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
 Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

# SELECTION

## 8MM Pitch HT200 Belt Drive Selection Table

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

# SELECTION

## 8MM Pitch HT200 Belt Drive Selection Table

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged. Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged. Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

## 14MM Pitch HT200 Belt Drive Selection Table

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged. Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

# SELECTION

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged. Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

# SELECTION

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged. Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.

Center distance is greater than eight times the Small Sprocket and the Large Sprocket is not flanged.  
Large Sprocket should be ordered with flanges as a special.

\* This length correction factor must be used to determine the proper belt width.
